- 237 584 spectra from 1121 *Apo-Ident* customers from a total of 45 448 batches from a further 342 substances. These spectra were recorded by *Apo-Ident* customers. *Type C* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#),

the samples are listed in the *Type C* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix C](#).

## Validation results

The validation runs checked whether the substance/substance group *Isopropyl alcohol 70%* can clearly be distinguished from all other substances using NIR spectroscopy with *Apo-Ident*. For this purpose, all relevant spectra of the various substances were compared with *Isopropyl alcohol 70%* and it was evaluated how many matches (positive) and rejections (negative) were correct or incorrect. The following table breaks down the numbers of correct and incorrect results according to the expected result (*positive/negative*) and the validation spectrum type (*A/B/C*).

|        | False positive | True positive | False negative | True negative |
|--------|----------------|---------------|----------------|---------------|
| Type A | 0              | 440           | 0              | 63 499        |
| Type B | 0              | 480           | 0              | 91 011        |
| Type C | 0              | 3765          | 14             | 237 584       |

The substance/substance group *Isopropyl alcohol 70%* can be clearly distinguished from all other substances. In order to make these figures comparable, the weighted *true negative rate* (*specificity*) and the weighted *true positive rate* (*recognition rate*) are determined:

|        | Specificity              | Recognition rate         |
|--------|--------------------------|--------------------------|
| Type A | 100.0000 % (> 99.9797 %) | 100.0000 % (> 98.6364 %) |
| Type B | 100.0000 % (> 99.9656 %) | 100.0000 % (> 98.7500 %) |
| Type C | 100.0000 % (> 99.6849 %) | 99.6295 % (> 99.5501 %)  |

In order to ensure that each substance is entered with the same weight irrespective of the number of spectra available, each spectrum is weighted with the reciprocal value of its number. (If several new spectra of a substance with a very distinctive spectrum are added, the values for *specificity* and *recognition rate* are safer, but are by no means idealised.)

In order to illustrate the impact of the number of spectra, a comparison is made in parentheses as to how the *specificity* or *recognition rate* would worsen if three additional incorrect results were to exist amongst the spectra (*Rule of Three* [10, 11]). The larger the number of spectra, the lower the deterioration if the three hypothetical *incorrect results* were added.

Where the number of spectra does not exceed 20, no *recognition rate* is provided.

## Nearest chemometric neighbours

The following table lists the closest chemometric neighbours of the substance/substance group *Isopropyl alcohol 70%* in the substance class *APIs & excipients, liquid/semi-solid (with analysis certificate)*. Furthermore, their *Mahalanobis distance* is specified within the main model and, where appropriate, within the second-stage model.

| Substance      | Distance in main model | Distance in second-stage model |
|----------------|------------------------|--------------------------------|
| Camphor spirit | 37.23                  | —                              |
| Spirit soap    | 63.31                  | —                              |

The list stops after the first substance with a *Mahalanobis distance* greater than 50. If the substance/substance group *Isopropyl alcohol 70%* is separated from critical neighbours in a second-stage model, all the remaining substances in the second-stage model follow.

## Identity according to identity test using NIR spectroscopy

For each substance, a certificate of the correct identity is obtained from an independent GMP-certified test laboratory. If the identity of the sample can be provided using NIR on an independently tested reference sample, in the following table the *Mahalanobis distance* to the reference sample is specified as well as the *Mahalanobis distance* to the next non-identical substance:

| Sample ID | Reference sample ID | Distance to reference sample | Distance to next foreign sample |
|-----------|---------------------|------------------------------|---------------------------------|
| 31388     | 31388               | 0.00                         | 76.32                           |
| 31622     | 32318               | 3.24                         | 61.03                           |
| 31831     | 32216               | 2.81                         | 72.57                           |
| 32216     | 32216               | 0.00                         | 75.13                           |
| 32318     | 32318               | 0.00                         | 58.67                           |
| 32319     | 32319               | 0.00                         | 58.21                           |
| 32320     | 32320               | 0.00                         | 59.96                           |
| 32322     | 32322               | 0.00                         | 59.66                           |
| 33105     | 33105               | 0.00                         | 58.18                           |
| 33106     | 33106               | 0.00                         | 58.88                           |

The identity of a sample will be confirmed by NIR if the distance to the next foreign sample is at least 50 % greater than the distance to a reference sample whose identity has been established by laboratory testing. This criterion is always considered in the chemometric model, which contains all substances of the substance class, even if a second-stage dissolves a subgroup of similar substances, thereby increasing the distances between them. The samples confirmed by NIR support the statistical variance of the original reference substance, but cannot add new aspects or forms of the substance.

# VALIDATION REPORT

## IdentModule 2.4-2021-04

Validated substance/substance group **Isopropyl myristate**  
Substance class APIs & excipients, liquid/semi-solid (with analysis certificate)  
Report date 08/11/2021  
Report number 30977-2021-11-08  
Executing company HiperScan GmbH  
Weißeritzstraße 3  
01067 Dresden  
Germany

### Relevant substance names

Isopropyl myristate; Isopropylis myristas

### Special notes

When selecting the *Isopropyl myristate* substance/substance group, the following information is displayed to the user:

*no information*

### Applicable documents

978-3-7692-7517-9 *European Pharmacopoeia 10th Edition, Basic Version 2020* [3]  
Komm2.2.40 *Erfüllung von Ph. Eur. 2.2.40 durch Apo-Ident* [4]  
AA004 *Erstellung und Validierung eines IdentModul-Updates*

### Validation method

Validation is performed after every change to the chemometric model (also “database”) in three steps:

1. The chemometric model is calculated from the calibration spectra using a *PCA algorithm*. The calibration spectra originate from the calibration samples of all substances in this class.
2. In the *chemometric model* generated, the distances between all separable substances are checked for compliance with the specified safety distances.
3. All spectra are presented to the generated chemometric model for evaluation. In three runs, the reference spectra (*Type A*), spectra from independent samples (*Type B*), and spectra from the field (*Type C*) are presented successively. Here, no single *false positive* result is permitted.

Finally, a report is generated from the validation run results and is archived together with the parameters of the model generation in audit-compliant manner.

### Number of independent samples (batches) in calibration and validation

A sample is considered independent if no sample from the same batch has been included in the calibration of the chemometric model.

| Substance/substance group | Type A | Type B | Type C |
|---------------------------|--------|--------|--------|
| Isopropyl myristate       | 6      | 4      | 95     |

## Second-stage model

For differentiation of the substance/substance group *Isopropyl myristate* the following second-stage model is used:

*no second-stage model*

## Calibration samples

Only spectra which have been recorded by *HiperScan GmbH* from traceable samples are used for the generation of the [chemometric models](#). The following samples have been obtained from the substance/substance group *Isopropyl myristate*:

| Supplier | Substance           | Batch      | Sample ID | Spectra | Certificate |
|----------|---------------------|------------|-----------|---------|-------------|
| Caelo    | Isopropyl myrist... | 12171522   | 30977     | 80      | 1408077     |
| Caelo    | Isopropyl myrist... | 13144311   | 31363     | 40      | 1412539     |
| Caelo    | Isopropyl myrist... | 192333     | 34726     | 40      | 20190911*   |
| Euro OTC | Isopropyl myrist... | 1303034-03 | 31530     | 60      | 20130502    |
| Euro OTC | Isopropyl myrist... | 1508035    | 31774     | 60      | 20150907*   |
| Euro OTC | Isopropyl myrist... | 2008023    | 35081     | 40      | 20200916*   |

## Validation samples

A total of 396 793 spectra were provided for validation. The results were evaluated separately according to the following sample categories:

**Type A** All calibration spectra.

- 320 spectra of 6 reference samples from the substance/substance group *Isopropyl myristate*. These samples are listed above in the [calibration samples](#) section. The reference samples come from 6 different batches.
- 63 619 spectra from a total of 1301 batches from further 223 substances. These spectra were recorded by *HiperScan GmbH*. *Type A* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type A* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix A](#). The samples in [Appendix A](#) were added for model generation not with the intention to have the model identify these substances, but with the intention to make the model reject them despite their similarity to substances identifiable.

**Type B** Spectra from independent samples not included in the database structure. Measurement is carried out by *HiperScan GmbH*.

Samples from batches of which no spectra have been included in the database structure are considered as independent samples. The number of batches from which independent samples supplied *Type B* spectra for validation is shown below, representing the number of independent *Type B* samples. Samples, of which some of the spectra have been included in the database structure and other spectra in the validation, are marked with a <sup>†</sup>. The following applies to the remaining unmarked samples: In the same batch, there was at least one additional sample (other sales container, other sample ID) from which reference spectra (*Type A*) were included in the database structure.

- 160 spectra of 4 reference samples from the substance/substance group *Isopropyl myristate*.

\*The spectra were taken from a part of the same sample which the supplier used for its analysis (identity, purity, content). In this case the manufacturer certificates proof the identity and quality of the sample from those the spectra descend.

- Among them are spectra of independent samples from 4 batches from which no spectra have been included in the database structure. They are sorted upwards in the following table and separated from the additional samples by a line.

| Supplier | Substance           | Batch   | Sample ID | Spectra |
|----------|---------------------|---------|-----------|---------|
| Caelo    | Isopropyl myristate | 172729  | 33882     | 40      |
| Caelo    | Isopropyl myristate | 181308  | 34234     | 40      |
| Euro OTC | Isopropyl myristate | 1608039 | 32776     | 40      |
| Euro OTC | Isopropyl myristate | 1801035 | 33926     | 40      |

- 91 331 spectra from a total of 2012 batches from further 345 substances. These spectra were recorded by *HiperScan GmbH*. *Type B* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type B* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix B](#).

**Type C** Spectra of independent samples not included in the database structure. *Apo-Ident* customers carry out the measurements. *HiperScan GmbH* generally does not verify the information provided by the customer regarding manufacturer and batch number.

- 499 spectra from 258 *Apo-Ident* customers from 98 batches from the substance/substance group *Isopropyl myristate*.
- Among them are spectra of independent samples from 95 batches from which no spectra have been included in the database structure. These are sorted upwards in the following table.

| Supplier  | Substance           | Batch       | Spectra |

- 240 864 spectra from 1121 *Apo-Ident* customers from a total of 46 909 batches from a further 342 substances. These spectra were recorded by *Apo-Ident* customers. *Type C* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type C* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix C](#).

## Validation results

The validation runs checked whether the substance/substance group *Isopropyl myristate* can clearly be distinguished from all other substances using NIR spectroscopy with *Apo-Ident*. For this purpose, all relevant spectra of the various substances were compared with *Isopropyl myristate* and it was evaluated how many matches (positive) and rejections (negative) were correct or incorrect. The following table breaks down the numbers of correct and incorrect results according to the expected result (*positive/negative*) and the validation spectrum type (*A/B/C*).

|               | False positive | True positive | False negative | True negative |
|---------------|----------------|---------------|----------------|---------------|
| <b>Type A</b> | 0              | 320           | 0              | 63 619        |
| <b>Type B</b> | 0              | 160           | 0              | 91 331        |
| <b>Type C</b> | 0              | 492           | 7              | 240 864       |

The substance/substance group *Isopropyl myristate* can be clearly distinguished from all other substances. In order to make these figures comparable, the weighted *true negative rate* (*specificity*) and the weighted *true positive rate* (*recognition rate*) are determined:

|               | Specificity              | Recognition rate         |
|---------------|--------------------------|--------------------------|
| <b>Type A</b> | 100.0000 % (> 99.9797 %) | 100.0000 % (> 98.1250 %) |
| <b>Type B</b> | 100.0000 % (> 99.9656 %) | 100.0000 % (> 96.2500 %) |
| <b>Type C</b> | 100.0000 % (> 99.6849 %) | 98.5972 % (> 97.9960 %)  |

In order to ensure that each substance is entered with the same weight irrespective of the number of spectra available, each spectrum is weighted with the reciprocal value of its number. (If several new spectra of a substance with a very distinctive spectrum are added, the values for *specificity* and *recognition rate* are safer, but are by no means idealised.)

In order to illustrate the impact of the number of spectra, a comparison is made in parentheses as to how the *specificity* or *recognition rate* would worsen if three additional incorrect results were to exist amongst the spectra ([Rule of Three](#) [10, 11]). The larger the number of spectra, the lower the deterioration if the three hypothetical *incorrect results* were added.

Where the number of spectra does not exceed 20, no *recognition rate* is provided.

## Nearest chemometric neighbours

The following table lists the closest chemometric neighbours of the substance/substance group *Isopropyl myristate* in the substance class *APIs & excipients, liquid/semi-solid (with analysis certificate)*. Furthermore, their *Mahalanobis distance* is specified within the main model and, where appropriate, within the second-stage model.

| Substance                             | Distance in main model | Distance in second-stage model |
|---------------------------------------|------------------------|--------------------------------|
| Isopropyl palmitate                   | 12.96                  | —                              |
| Metronidazole 25% in white petrolatum | 19.65                  | —                              |
| Wool fat                              | 26.92                  | —                              |

continued on the next page

continued from previous page

| Substanz                             | Distance in<br>main model | Distance in<br>second-stage model |
|--------------------------------------|---------------------------|-----------------------------------|
| Shea butter, refined                 | 28.43                     | —                                 |
| Triglycerides, medium-chain          | 32.97                     | —                                 |
| Camphor ointment                     | 33.57                     | —                                 |
| Pasta Cordes <sup>®</sup>            | 34.90                     | —                                 |
| Laurel oil                           | 39.31                     | —                                 |
| Softisan <sup>®</sup> 378            | 44.36                     | —                                 |
| Permethrin 25% solution              | 46.80                     | —                                 |
| Squalane                             | 48.63                     | —                                 |
| Emulsifying hydrophobic base gel DAC | 55.08                     | —                                 |

The list stops after the first substance with a *Mahalanobis distance* greater than 50. If the substance/substance group *Isopropyl myristate* is separated from critical neighbours in a second-stage model, all the remaining substances in the second-stage model follow.

### Identity according to identity test using NIR spectroscopy

For each substance, a certificate of the correct identity is obtained from an independent GMP-certified test laboratory. If the identity of the sample can be provided using NIR on an independently tested reference sample, in the following table the *Mahalanobis distance* to the reference sample is specified as well as the *Mahalanobis distance* to the next non-identical substance:

| Sample ID | Reference<br>sample ID | Distance to<br>reference sample | Distance to<br>next foreign sample |
|-----------|------------------------|---------------------------------|------------------------------------|
| 30977     | 30977                  | 0.00                            | 29.47                              |
| 31363     | 31363                  | 0.00                            | 21.96                              |
| 31530     | 31774                  | 1.44                            | 25.22                              |
| 31774     | 31774                  | 0.00                            | 23.80                              |
| 34726     | 34726                  | 0.00                            | 24.81                              |
| 35081     | 35081                  | 0.00                            | 26.26                              |

The identity of a sample will be confirmed by NIR if the distance to the next foreign sample is at least 50 % greater than the distance to a reference sample whose identity has been established by laboratory testing. This criterion is always considered in the chemometric model, which contains all substances of the substance class, even if a second-stage dissolves a subgroup of similar substances, thereby increasing the distances between them. The samples confirmed by NIR support the statistical variance of the original reference substance, but cannot add new aspects or forms of the substance.

# VALIDATION REPORT

## IdentModule 2.4-2021-04

Validated substance/substance group **Isopropyl palmitate**  
Substance class APIs & excipients, liquid/semi-solid (with analysis certificate)  
Report date 08/11/2021  
Report number 30868-2021-11-08  
Executing company HiperScan GmbH  
Weißeritzstraße 3  
01067 Dresden  
Germany

### Relevant substance names

Isopropyl palmitate; Isopropylis palmitas

### Special notes

When selecting the *Isopropyl palmitate* substance/substance group, the following information is displayed to the user:

*no information*

### Applicable documents

978-3-7692-7517-9 *European Pharmacopoeia 10th Edition, Basic Version 2020* [3]  
Komm2.2.40 *Erfüllung von Ph. Eur. 2.2.40 durch Apo-Ident* [4]  
AA004 *Erstellung und Validierung eines IdentModul-Updates*

### Validation method

Validation is performed after every change to the chemometric model (also “database”) in three steps:

1. The chemometric model is calculated from the calibration spectra using a *PCA algorithm*. The calibration spectra originate from the calibration samples of all substances in this class.
2. In the *chemometric model* generated, the distances between all separable substances are checked for compliance with the specified safety distances.
3. All spectra are presented to the generated chemometric model for evaluation. In three runs, the reference spectra (*Type A*), spectra from independent samples (*Type B*), and spectra from the field (*Type C*) are presented successively. Here, no single *false positive* result is permitted.

Finally, a report is generated from the validation run results and is archived together with the parameters of the model generation in audit-compliant manner.

### Number of independent samples (batches) in calibration and validation

A sample is considered independent if no sample from the same batch has been included in the calibration of the chemometric model.

| Substance/substance group | Type A | Type B | Type C |
|---------------------------|--------|--------|--------|
| Isopropyl palmitate       | 6      | 3      | 110    |

## Second-stage model

For differentiation of the substance/substance group *Isopropyl palmitate* the following second-stage model is used:

*no second-stage model*

## Calibration samples

Only spectra which have been recorded by *HiperScan GmbH* from traceable samples are used for the generation of the [chemometric models](#). The following samples have been obtained from the substance/substance group *Isopropyl palmitate*:

| Supplier  | Substance           | Batch    | Sample ID | Spectra | Certificate        |
|-----------|---------------------|----------|-----------|---------|--------------------|
| Bombastus | Isopropyl palmit... | 284060   | 31268     | 40      | 20131119           |
| Bombastus | Isopropyl palmit... | 306390   | 32995     | 40      | 20161219           |
| Bombastus | Isopropyl palmit... | 306390   | 33040     | 40      | 20161219           |

| Caelo     | Isopropyl palmit... | 20002049 | 35453     | 40      | 20200914*          |

## Validation samples

A total of 396 793 spectra were provided for validation. The results were evaluated separately according to the following sample categories:

**Type A** All calibration spectra.

- 280 spectra of 7 reference samples from the substance/substance group *Isopropyl palmitate*. These samples are listed above in the [calibration samples](#) section. The reference samples come from 6 different batches.
- 63 659 spectra from a total of 1301 batches from further 223 substances. These spectra were recorded by *HiperScan GmbH*. *Type A* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type A* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix A](#). The samples in [Appendix A](#) were added for model generation not with the intention to have the model identify these substances, but with the intention to make the model reject them despite their similarity to substances identifiable.

**Type B** Spectra from independent samples not included in the database structure. Measurement is carried out by *HiperScan GmbH*.

Samples from batches of which no spectra have been included in the database structure are considered as independent samples. The number of batches from which independent samples supplied *Type B* spectra for validation is shown below, representing the number of independent *Type B* samples. Samples, of which some of the spectra have been included in the database structure and other spectra in the validation, are marked with a <sup>†</sup>. The following applies to the remaining unmarked samples: In the same batch, there was at least one additional sample (other sales container, other sample ID) from which reference spectra (*Type A*) were included in the database structure.

- 120 spectra of 3 reference samples from the substance/substance group *Isopropyl palmitate*.

\*The spectra were taken from a part of the same sample which the supplier used for its analysis (identity, purity, content). In this case the manufacturer certificates proof the identity and quality of the sample from those the spectra descend.

- Among them are spectra of independent samples from 3 batches from which no spectra have been included in the database structure. They are sorted upwards in the following table and separated from the additional samples by a line.

| Supplier | Substance           | Batch    | Sample ID | Spectra |
|----------|---------------------|----------|-----------|---------|
| Caelo    | Isopropyl palmitate | 16091706 | 32570     | 40      |
| Caelo    | Isopropyl palmitate | 180672   | 34079     | 40      |
| Caelo    | Isopropyl palmitate | 192499   | 34727     | 40      |

- 91371 spectra from a total of 2013 batches from further 345 substances. These spectra were recorded by *HiperScan GmbH*. *Type B* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type B* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix B](#).

**Type C** Spectra of independent samples not included in the database structure. *Apo-Ident* customers carry out the measurements. *HiperScan GmbH* generally does not verify the information provided by the customer regarding manufacturer and batch number.

- 713 spectra from 377 *Apo-Ident* customers from 117 batches from the substance/substance group *Isopropyl palmitate*.
- Among them are spectra of independent samples from 110 batches from which no spectra have been included in the database structure. These are sorted upwards in the following table.

| Supplier             | Substance           | Batch           | Spectra |
|----------------------|---------------------|-----------------|---------|
| AHD                  | Isopropyl palmitate | 14034801        | 1       |

- 240 650 spectra from 1121 *Apo-Ident* customers from a total of 46 892 batches from a further 342 substances. These spectra were recorded by *Apo-Ident* customers. *Type C* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type C* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix C](#).

## Validation results

The validation runs checked whether the substance/substance group *Isopropyl palmitate* can clearly be distinguished from all other substances using NIR spectroscopy with *Apo-Ident*. For this purpose, all relevant spectra of the various substances were compared with *Isopropyl palmitate* and it was evaluated how many matches (positive) and rejections (negative) were correct or incorrect. The following table breaks down the numbers of correct and incorrect results according to the expected result (*positive/negative*) and the validation spectrum type (*A/B/C*).

|               | False positive | True positive | False negative | True negative |
|---------------|----------------|---------------|----------------|---------------|
| <b>Type A</b> | 0              | 280           | 0              | 63 659        |
| <b>Type B</b> | 0              | 120           | 0              | 91 371        |
| <b>Type C</b> | 0              | 711           | 2              | 240 650       |

The substance/substance group *Isopropyl palmitate* can be clearly distinguished from all other substances. In order to make these figures comparable, the weighted *true negative rate* (*specificity*) and the weighted *true positive rate* (*recognition rate*) are determined:

|               | Specificity              | Recognition rate         |
|---------------|--------------------------|--------------------------|
| <b>Type A</b> | 100.0000 % (> 99.9798 %) | 100.0000 % (> 97.8571 %) |
| <b>Type B</b> | 100.0000 % (> 99.9656 %) | 100.0000 % (> 95.0000 %) |
| <b>Type C</b> | 100.0000 % (> 99.6849 %) | 99.7195 % (> 99.2987 %)  |

In order to ensure that each substance is entered with the same weight irrespective of the number of spectra available, each spectrum is weighted with the reciprocal value of its number. (If several new spectra of a substance with a very distinctive spectrum are added, the values for *specificity* and *recognition rate* are safer, but are by no means idealised.)

In order to illustrate the impact of the number of spectra, a comparison is made in parentheses as to how the *specificity* or *recognition rate* would worsen if three additional incorrect results were to exist amongst the spectra ([Rule of Three](#) [10, 11]). The larger the number of spectra, the lower the deterioration if the three hypothetical *incorrect results* were added.

Where the number of spectra does not exceed 20, no *recognition rate* is provided.

## Nearest chemometric neighbours

The following table lists the closest chemometric neighbours of the substance/substance group *Isopropyl palmitate* in the substance class *APIs & excipients, liquid/semi-solid (with analysis certificate)*. Furthermore, their *Mahalanobis distance* is specified within the main model and, where appropriate, within the second-stage model.

| Substance                             | Distance in<br>main model | Distance in<br>second-stage model |
|---------------------------------------|---------------------------|-----------------------------------|
| Isopropyl myristate                   | 13.61                     | —                                 |
| Metronidazole 25% in white petrolatum | 15.88                     | —                                 |
| Wool fat                              | 19.66                     | —                                 |
| Shea butter, refined                  | 20.42                     | —                                 |
| Pasta Cordes <sup>®</sup>             | 24.15                     | —                                 |
| Softisan <sup>®</sup> 378             | 26.59                     | —                                 |
| Laurel oil                            | 26.72                     | —                                 |
| Camphor ointment                      | 37.62                     | —                                 |
| Permethrin 25% solution               | 38.11                     | —                                 |
| Triglycerides, medium-chain           | 38.86                     | —                                 |
| Paraffin, yellow                      | 40.89                     | —                                 |
| Emulsifying hydrophobic base gel DAC  | 41.93                     | —                                 |
| Peanut oil, refined                   | 46.01                     | —                                 |
| Wool alcohol ointment DAB             | 46.27                     | —                                 |
| Paraffin, white                       | 46.44                     | —                                 |
| Squalane                              | 47.42                     | —                                 |
| Paraffin, light liquid                | 47.66                     | —                                 |
| Olive oil, native                     | 48.16                     | —                                 |
| Avocado oil, refined                  | 53.11                     | —                                 |

The list stops after the first substance with a *Mahalanobis distance* greater than 50. If the substance/substance group *Isopropyl palmitate* is separated from critical neighbours in a second-stage model, all the remaining substances in the second-stage model follow.

### Identity according to identity test using NIR spectroscopy

For each substance, a certificate of the correct identity is obtained from an independent GMP-certified test laboratory. If the identity of the sample can be provided using NIR on an independently tested reference sample, in the following table the *Mahalanobis distance* to the reference sample is specified as well as the *Mahalanobis distance* to the next non-identical substance:

| Sample ID | Reference<br>sample ID | Distance to<br>reference sample | Distance to<br>next foreign sample |
|-----------|------------------------|---------------------------------|------------------------------------|
| 30868     | 35453                  | 4.08                            | 15.88                              |
| 31268     | 31364                  | 2.70                            | 17.68                              |
| 31364     | 31364                  | 0.00                            | 18.38                              |
| 32995     | 35453                  | 11.69                           | 22.77                              |
| 33040     | 35453                  | 9.99                            | 21.90                              |
| 35289     | 35453                  | 1.39                            | 18.30                              |
| 35453     | 35453                  | 0.00                            | 17.89                              |

The identity of a sample will be confirmed by NIR if the distance to the next foreign sample is at least 50 % greater than the distance to a reference sample whose identity has been established by laboratory testing. This criterion is always considered in the chemometric model, which contains all substances of the substance class, even if a second-stage dissolves a subgroup of similar substances, thereby increasing the distances between them. The samples confirmed by NIR support the statistical variance of the original reference substance, but cannot add new aspects or forms of the substance.

# VALIDATION REPORT

## IdentModule 2.4-2021-04

Validated substance/substance group **Juniper oil**  
Substance class APIs & excipients, liquid/semi-solid (with analysis certificate)  
Report date 08/11/2021  
Report number 30711-2021-11-08  
Executing company HiperScan GmbH  
Weißeritzstraße 3  
01067 Dresden  
Germany

### Relevant substance names

Juniper oil; Juniperi aetheroleum

### Special notes

When selecting the *Juniper oil* substance/substance group, the following information is displayed to the user:

*no information*

### Applicable documents

978-3-7692-7517-9 *European Pharmacopoeia 10th Edition, Basic Version 2020* [3]  
Komm2.2.40 *Erfüllung von Ph. Eur. 2.2.40 durch Apo-Ident* [4]  
AA004 *Erstellung und Validierung eines IdentModul-Updates*

### Validation method

Validation is performed after every change to the chemometric model (also “database”) in three steps:

1. The chemometric model is calculated from the calibration spectra using a *PCA algorithm*. The calibration spectra originate from the calibration samples of all substances in this class.
2. In the *chemometric model* generated, the distances between all separable substances are checked for compliance with the specified safety distances.
3. All spectra are presented to the generated chemometric model for evaluation. In three runs, the reference spectra (*Type A*), spectra from independent samples (*Type B*), and spectra from the field (*Type C*) are presented successively. Here, no single *false positive* result is permitted.

Finally, a report is generated from the validation run results and is archived together with the parameters of the model generation in audit-compliant manner.

### Number of independent samples (batches) in calibration and validation

A sample is considered independent if no sample from the same batch has been included in the calibration of the chemometric model.

| Substance/substance group | Type A | Type B | Type C |
|---------------------------|--------|--------|--------|
| Juniper oil               | 5      | 2      | 15     |

## Second-stage model

For differentiation of the substance/substance group *Juniper oil* the following second-stage model is used:

*no second-stage model*

## Calibration samples

Only spectra which have been recorded by *HiperScan GmbH* from traceable samples are used for the generation of the [chemometric models](#). The following samples have been obtained from the substance/substance group *Juniper oil*:

| Supplier | Substance   | Batch    | Sample ID | Spectra | Certificate |
|----------|-------------|----------|-----------|---------|-------------|
| Caelo    | Juniper oil | 11379007 | 30711     | 40      | 1404599     |
| Caelo    | Juniper oil | 13240811 | 31665     | 60      | 20130726    |
| Caelo    | Juniper oil | 16160703 | 32918     | 40      | 1708747     |
| Caelo    | Juniper oil | 171597   | 33311     | 40      | 20170601*   |
| Caelo    | Juniper oil | 192077   | 34618     | 40      | 20190801*   |

## Validation samples

A total of 396 793 spectra were provided for validation. The results were evaluated separately according to the following sample categories:

### Type A All calibration spectra.

- 220 spectra of 5 reference samples from the substance/substance group *Juniper oil*. These samples are listed above in the [calibration samples](#) section. The reference samples come from 5 different batches.
- 63 719 spectra from a total of 1302 batches from further 223 substances. These spectra were recorded by *HiperScan GmbH*. *Type A* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type A* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix A](#). The samples in [Appendix A](#) were added for model generation not with the intention to have the model identify these substances, but with the intention to make the model reject them despite their similarity to substances identifiable.

### Type B Spectra from independent samples not included in the database structure. Measurement is carried out by *HiperScan GmbH*.

Samples from batches of which no spectra have been included in the database structure are considered as independent samples. The number of batches from which independent samples supplied *Type B* spectra for validation is shown below, representing the number of independent *Type B* samples. Samples, of which some of the spectra have been included in the database structure and other spectra in the validation, are marked with a <sup>†</sup>. The following applies to the remaining unmarked samples: In the same batch, there was at least one additional sample (other sales container, other sample ID) from which reference spectra (*Type A*) were included in the database structure.

- 50 spectra of 2 reference samples from the substance/substance group *Juniper oil*.
- Among them are spectra of independent samples from 2 batches from which no spectra have been included in the database structure. They are sorted upwards in the following table and separated from the additional samples by a line.

\*The spectra were taken from a part of the same sample which the supplier used for its analysis (identity, purity, content). In this case the manufacturer certificates proof the identity and quality of the sample from those the spectra descend.

| Supplier | Substance   | Batch    | Sample ID | Spectra |
|----------|-------------|----------|-----------|---------|
| Caelo    | Juniper oil | 13240807 | 31244     | 10      |
| Caelo    | Juniper oil | 15185205 | 32352     | 40      |

- 91 441 spectra from a total of 2014 batches from further 345 substances. These spectra were recorded by *HiperScan GmbH*. *Type B* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type B* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix B](#).

**Type C** Spectra of independent samples not included in the database structure. *Apo-Ident* customers carry out the measurements. *HiperScan GmbH* generally does not verify the information provided by the customer regarding manufacturer and batch number.

- 29 spectra from 22 *Apo-Ident* customers from 16 batches from the substance/substance group *Juniper oil*.
- Among them are spectra of independent samples from 15 batches from which no spectra have been included in the database structure. These are sorted upwards in the following table.

| Supplier                   | Substance   | Batch        | Spectra |
|----------------------------|-------------|--------------|---------|
| Caelo                      | Juniper oil | 11379012     | 2       |
| Caelo                      | Juniper oil | 11379006     | 1       |
| Caelo                      | Juniper oil | 18121306     | 1       |
| Caelo                      | Juniper oil | 12322707     | 1       |
| Caelo                      | Juniper oil | 11379003     | 1       |
| Caelo                      | Juniper oil | 18056101     | 6       |
| Caelo                      | Juniper oil | 16160702     | 1       |
| Caelo                      | Juniper oil | 111275       | 1       |
| Caelo                      | Juniper oil | 14115802     | 3       |
| Caelo                      | Juniper oil | 13240802     | 3       |
| Caelo                      | Juniper oil | 15141302     | 1       |
| Caesar & Loretz GmbH       | Juniper oil | 19207701     | 1       |
| Caesar & Loretz GmbH/AHD   | Juniper oil | 19207701     | 1       |
| Caesar & Loretz GmbH/Sa... | Juniper oil | 192077005    | 1       |
| Kögl                       | Juniper oil | 104204171714 | 1       |
| Caelo                      | Juniper oil | 15185205     | 1       |
| Sanacorp                   | Juniper oil | 11379012     | 1       |
| VDL;15.05.15;9,95EUR       | Juniper oil | 14115802     | 1       |
| Caelo                      | Juniper oil | 11379007     | 1       |

- 241 334 spectra from 1121 *Apo-Ident* customers from a total of 46 990 batches from a further 342 substances. These spectra were recorded by *Apo-Ident* customers. *Type C* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type C* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix C](#).

## Validation results

The validation runs checked whether the substance/substance group *Juniper oil* can clearly be distinguished from all other substances using NIR spectroscopy with *Apo-Ident*. For this purpose, all relevant spectra of the various substances were compared with *Juniper oil* and it was evaluated how many matches (positive) and rejections (negative) were correct or incorrect. The following table breaks down the numbers of correct and incorrect results according to the expected result (*positive/negative*) and the validation spectrum type (*A/B/C*).

|        | False positive | True positive | False negative | True negative |
|--------|----------------|---------------|----------------|---------------|
| Type A | 0              | 220           | 0              | 63 719        |
| Type B | 0              | 48            | 2              | 91 441        |
| Type C | 0              | 27            | 2              | 241 334       |

The substance/substance group *Juniper oil* can be clearly distinguished from all other substances. In order to make these figures comparable, the weighted *true negative rate (specificity)* and the weighted *true positive rate (recognition rate)* are determined:

|        | Specificity              | Recognition rate         |
|--------|--------------------------|--------------------------|
| Type A | 100.0000 % (> 99.9798 %) | 100.0000 % (> 97.2727 %) |
| Type B | 100.0000 % (> 99.9657 %) | 96.0000 % (> 90.0000 %)  |
| Type C | 100.0000 % (> 99.6852 %) | 93.1034 % (> 82.7586 %)  |

In order to ensure that each substance is entered with the same weight irrespective of the number of spectra available, each spectrum is weighted with the reciprocal value of its number. (If several new spectra of a substance with a very distinctive spectrum are added, the values for *specificity* and *recognition rate* are safer, but are by no means idealised.)

In order to illustrate the impact of the number of spectra, a comparison is made in parentheses as to how the *specificity* or *recognition rate* would worsen if three additional incorrect results were to exist amongst the spectra (*Rule of Three* [10, 11]). The larger the number of spectra, the lower the deterioration if the three hypothetical *incorrect results* were added.

Where the number of spectra does not exceed 20, no *recognition rate* is provided.

### Nearest chemometric neighbours

The following table lists the closest chemometric neighbours of the substance/substance group *Juniper oil* in the substance class *APIs & excipients, liquid/semi-solid (with analysis certificate)*. Furthermore, their *Mahalanobis distance* is specified within the main model and, where appropriate, within the second-stage model.

| Substance                     | Distance in main model | Distance in second-stage model |
|-------------------------------|------------------------|--------------------------------|
| Dwarf pine oil                | 15.44                  | —                              |
| Cedar wood oil                | 25.87                  | —                              |
| Cypress oil                   | 26.00                  | —                              |
| Bergamot oil                  | 28.74                  | —                              |
| Spearmint oil                 | 29.28                  | —                              |
| Pine silvestris oil           | 31.90                  | —                              |
| Acorus oil                    | 31.91                  | —                              |
| Angelica root oil             | 31.94                  | —                              |
| Caraway oil                   | 32.92                  | —                              |
| Peppermint oil                | 38.64                  | —                              |
| Bitter orange oil             | 39.45                  | —                              |
| Citric oil                    | 41.35                  | —                              |
| Verbena oil, nature-identical | 41.96                  | —                              |
| Turpentine oil                | 47.07                  | —                              |
| Grapefruit oil                | 47.40                  | —                              |
| Myrtle oil                    | 47.86                  | —                              |
| Eucalyptus oil                | 47.94                  | —                              |

The list stops after the first substance with a *Mahalanobis distance* greater than 50. If the substance/substance group *Juniper oil* is separated from critical neighbours in a second-stage model, all the remaining substances in the second-stage model follow.

### Identity according to identity test using NIR spectroscopy

For each substance, a certificate of the correct identity is obtained from an independent GMP-certified test laboratory. If the identity of the sample can be provided using NIR on an independently tested

reference sample, in the following table the *Mahalanobis distance* to the reference sample is specified as well as the *Mahalanobis distance* to the next non-identical substance:

| Sample ID | Reference sample ID | Distance to reference sample | Distance to next foreign sample |
|-----------|---------------------|------------------------------|---------------------------------|
| 30711     | 30711               | 0.00                         | 29.02                           |
| 31665     | 30711               | 16.62                        | 26.00                           |
| 32918     | 32918               | 0.00                         | 31.94                           |
| 33311     | 33311               | 0.00                         | 25.68                           |
| 34618     | 34618               | 0.00                         | 27.39                           |

The identity of a sample will be confirmed by NIR if the distance to the next foreign sample is at least 50 % greater than the distance to a reference sample whose identity has been established by laboratory testing. This criterion is always considered in the chemometric model, which contains all substances of the substance class, even if a second-stage dissolves a subgroup of similar substances, thereby increasing the distances between them. The samples confirmed by NIR support the statistical variance of the original reference substance, but cannot add new aspects or forms of the substance.

# VALIDATION REPORT

## IdentModule 2.4-2021-04

Validated substance/substance group **Lanette® ointment (conserved)**  
Substance class APIs & excipients, liquid/semi-solid (with analysis certificate)  
Report date 08/11/2021  
Report number 30499-2021-11-08  
Executing company HiperScan GmbH  
Weißeritzstraße 3  
01067 Dresden  
Germany

### Relevant substance names

Lanette® ointment (conserved); Unguentum Lanette®

### Special notes

When selecting the *Lanette® ointment (conserved)* substance/substance group, the following information is displayed to the user:

*no information*

### Applicable documents

978-3-7692-7517-9 *European Pharmacopoeia 10th Edition, Basic Version 2020* [3]  
Komm2.2.40 *Erfüllung von Ph. Eur. 2.2.40 durch Apo-Ident* [4]  
AA004 *Erstellung und Validierung eines IdentModul-Updates*

### Validation method

Validation is performed after every change to the chemometric model (also “database”) in three steps:

1. The chemometric model is calculated from the calibration spectra using a *PCA algorithm*. The calibration spectra originate from the calibration samples of all substances in this class.
2. In the *chemometric model* generated, the distances between all separable substances are checked for compliance with the specified safety distances.
3. All spectra are presented to the generated chemometric model for evaluation. In three runs, the reference spectra (*Type A*), spectra from independent samples (*Type B*), and spectra from the field (*Type C*) are presented successively. Here, no single *false positive* result is permitted.

Finally, a report is generated from the validation run results and is archived together with the parameters of the model generation in audit-compliant manner.

### Number of independent samples (batches) in calibration and validation

A sample is considered independent if no sample from the same batch has been included in the calibration of the chemometric model.

| Substance/substance group     | Type A | Type B | Type C |
|-------------------------------|--------|--------|--------|
| Lanette® ointment (conserved) | 11     | 16     | 144    |

## Second-stage model

For differentiation of the substance/substance group *Lanette<sup>®</sup> ointment (conserved)* the following second-stage model is used:

- [Submodel 06](#)

## Calibration samples

Only spectra which have been recorded by *HiperScan GmbH* from traceable samples are used for the generation of the [chemometric models](#). The following samples have been obtained from the substance/substance group *Lanette<sup>®</sup> ointment (conserved)*:

| Supplier | Substance                       | Batch    | Sample ID | Spectra | Certificate |
|----------|---------------------------------|----------|-----------|---------|-------------|
| Caelo    | Lanette <sup>®</sup> ointmen... | 13257301 | 31166     | 37      | 1402587     |
| Caelo    | Lanette <sup>®</sup> ointmen... | 13257301 | 31225     | 40      | 1403113     |

## Validation samples

A total of 396 793 spectra were provided for validation. The results were evaluated separately according to the following sample categories:

**Type A** All calibration spectra.

- 597 spectra of 14 reference samples from the substance/substance group *Lanette<sup>®</sup> ointment (conserved)*. These samples are listed above in the [calibration samples](#) section. The reference samples come from 11 different batches.
- 63 342 spectra from a total of 1296 batches from further 223 substances. These spectra were recorded by *HiperScan GmbH*. *Type A* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type A* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix A](#). The samples in [Appendix A](#) were added for model generation not with the intention to have the model identify these substances, but with the intention to make the model reject them despite their similarity to substances identifiable.

**Type B** Spectra from independent samples not included in the database structure. Measurement is carried out by *HiperScan GmbH*.

Samples from batches of which no spectra have been included in the database structure are considered as independent samples. The number of batches from which independent samples supplied *Type B* spectra for validation is shown below, representing the number of independent *Type B* samples.

\*The spectra were taken from a part of the same sample which the supplier used for its analysis (identity, purity, content). In this case the manufacturer certificates proof the identity and quality of the sample from those the spectra descend.

Samples, of which some of the spectra have been included in the database structure and other spectra in the validation, are marked with a <sup>†</sup>. The following applies to the remaining unmarked samples: In the same batch, there was at least one additional sample (other sales container, other sample ID) from which reference spectra (*Type A*) were included in the database structure.

- 723 spectra of 19 reference samples from the substance/substance group *Lanette<sup>®</sup> ointment (conserved)*.
- Among them are spectra of independent samples from 16 batches from which no spectra have been included in the database structure. They are sorted upwards in the following table and separated from the additional samples by a line.

| Supplier | Substance                                 | Batch    | Sample ID          | Spectra |
|----------|-------------------------------------------|----------|--------------------|---------|
| Caelo    | Lanette <sup>®</sup> ointment (conserved) | 162582   | 32504              | 40      |
| Caelo    | Lanette <sup>®</sup> ointment (conserved) | 170567   | 33144              | 40      |
| Caelo    | Lanette <sup>®</sup> ointment (conserved) | 170415   | 33145              | 40      |
| Caelo    | Lanette <sup>®</sup> ointment (conserved) | 172430   | 33752              | 40      |
| Caelo    | Lanette <sup>®</sup> ointment (conserved) | 172431   | 33753              | 40      |
| Caelo    | Lanette <sup>®</sup> ointment (conserved) | 173110   | 34008              | 40      |
| Caelo    | Lanette <sup>®</sup> ointment (conserved) | 180232   | 34196              | 40      |
| Caelo    | Lanette <sup>®</sup> ointment (conserved) | 180870   | 34197              | 40      |
| Caelo    | Lanette <sup>®</sup> ointment (conserved) | 181184   | 34198              | 40      |
| Caelo    | Lanette <sup>®</sup> ointment (conserved) | 182334   | 34263              | 40      |
| Caelo    | Lanette <sup>®</sup> ointment (conserved) | 20002187 | 35102              | 40      |
| Caelo    | Lanette <sup>®</sup> ointment (conserved) | 20003101 | 35168              | 40      |
| Caelo    | Lanette <sup>®</sup> ointment (conserved) | 21001236 | 35340              | 40      |

- 90 768 spectra from a total of 1998 batches from further 345 substances. These spectra were recorded by *HiperScan GmbH*. *Type B* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type B* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix B](#).

**Type C** Spectra of independent samples not included in the database structure. *Apo-Ident* customers carry out the measurements. *HiperScan GmbH* generally does not verify the information provided by the customer regarding manufacturer and batch number.

- 1015 spectra from 279 *Apo-Ident* customers from 148 batches from the substance/substance group *Lanette<sup>®</sup> ointment (conserved)*.
- Among them are spectra of independent samples from 144 batches from which no spectra have been included in the database structure. These are sorted upwards in the following table.

| Supplier | Substance                                 | Batch       | Spectra |
|----------|-------------------------------------------|-------------|---------|
| AHD      | Lanette <sup>®</sup> ointment (conserved) | 14089801    | 1       |
| Caelo    | Lanette <sup>®</sup> ointment (conserved) | 20002187004 | 3       |

*continued on the next page*

<sup>†</sup>These spectra were recorded from material of the same package as the corresponding calibration spectra (*Type A*). Hence, these spectra are not independent and are not of *Type B*.

- 240 348 spectra from 1121 *Apo-Ident* customers from a total of 46 863 batches from a further 342 substances. These spectra were recorded by *Apo-Ident* customers. *Type C* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type C* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix C](#).

## Validation results

The validation runs checked whether the substance/substance group *Lanette<sup>®</sup> ointment (conserved)* can clearly be distinguished from all other substances using NIR spectroscopy with *Apo-Ident*. For this purpose, all relevant spectra of the various substances were compared with *Lanette<sup>®</sup> ointment (conserved)* and it was evaluated how many matches (positive) and rejections (negative) were correct or incorrect. The following table breaks down the numbers of correct and incorrect results according to the expected result (*positive/negative*) and the validation spectrum type (*A/B/C*).

|               | False positive | True positive | False negative | True negative |
|---------------|----------------|---------------|----------------|---------------|
| <b>Type A</b> | 0              | 597           | 0              | 63 342        |
| <b>Type B</b> | 0              | 722           | 1              | 90 768        |
| <b>Type C</b> | 0              | 895           | 120            | 240 348       |

The substance/substance group *Lanette<sup>®</sup> ointment (conserved)* can be clearly distinguished from all other substances. In order to make these figures comparable, the weighted *true negative rate (specificity)* and the weighted *true positive rate (recognition rate)* are determined:

|               | <b>Specificity</b>       | <b>Recognition rate</b>  |
|---------------|--------------------------|--------------------------|
| <b>Type A</b> | 100.0000 % (> 99.9797 %) | 100.0000 % (> 98.9950 %) |
| <b>Type B</b> | 100.0000 % (> 99.9655 %) | 99.8617 % (> 99.4467 %)  |
| <b>Type C</b> | 100.0000 % (> 99.6849 %) | 88.1773 % (> 87.8818 %)  |

In order to ensure that each substance is entered with the same weight irrespective of the number of spectra available, each spectrum is weighted with the reciprocal value of its number. (If several new spectra of a substance with a very distinctive spectrum are added, the values for *specificity* and *recognition rate* are safer, but are by no means idealised.)

In order to illustrate the impact of the number of spectra, a comparison is made in parentheses as to how the *specificity* or *recognition rate* would worsen if three additional incorrect results were to exist amongst the spectra (*Rule of Three* [10, 11]). The larger the number of spectra, the lower the deterioration if the three hypothetical *incorrect results* were added.

Where the number of spectra does not exceed 20, no *recognition rate* is provided.

### Nearest chemometric neighbours

The following table lists the closest chemometric neighbours of the substance/substance group *Lanette<sup>®</sup> ointment (conserved)* in the substance class *APIs & excipients, liquid/semi-solid (with analysis certificate)*. Furthermore, their *Mahalanobis distance* is specified within the main model and, where appropriate, within the second-stage model.

| <b>Substance</b>                           | <b>Distance in main model</b> | <b>Distance in second-stage model</b> |

| 2-ethylhexyl laurate                       | >50                           | 233.50                                |
| Squalane                                   | >50                           | 249.38                                |

The list stops after the first substance with a *Mahalanobis distance* greater than 50. If the substance/substance group *Lanette<sup>®</sup> ointment (conserved)* is separated from critical neighbours in a second-stage model, all the remaining substances in the second-stage model follow.

### Identity according to identity test using NIR spectroscopy

For each substance, a certificate of the correct identity is obtained from an independent GMP-certified test laboratory. If the identity of the sample can be provided using NIR on an independently tested

reference sample, in the following table the *Mahalanobis distance* to the reference sample is specified as well as the *Mahalanobis distance* to the next non-identical substance:

| Sample ID | Reference sample ID | Distance to reference sample | Distance to next foreign sample |
|-----------|---------------------|------------------------------|---------------------------------|
| 31166     | 31166               | 0.00                         | 36.62                           |
| 31225     | 31225               | 0.00                         | 25.78                           |
| 31454     | 31225               | 2.50                         | 23.98                           |
| 31913     | 31913               | 0.00                         | 33.28                           |
| 31914     | 31914               | 0.00                         | 28.59                           |
| 31915     | 31915               | 0.00                         | 30.67                           |

| 34541     | 34541               | 0.00                         | 35.94                           |
| 35220     | 35220               | 0.00                         | 25.78                           |

The identity of a sample will be confirmed by NIR if the distance to the next foreign sample is at least 50 % greater than the distance to a reference sample whose identity has been established by laboratory testing. This criterion is always considered in the chemometric model, which contains all substances of the substance class, even if a second-stage dissolves a subgroup of similar substances, thereby increasing the distances between them. The samples confirmed by NIR support the statistical variance of the original reference substance, but cannot add new aspects or forms of the substance.

# VALIDATION REPORT

## IdentModule 2.4-2021-04

Validated substance/substance group **Lanolin DAB**  
Substance class APIs & excipients, liquid/semi-solid (with analysis certificate)  
Report date 08/11/2021  
Report number 30013-2021-11-08  
Executing company HiperScan GmbH  
Weißeritzstraße 3  
01067 Dresden  
Germany

### Relevant substance names

Lanolin DAB; Lanolinum DAB

### Special notes

When selecting the *Lanolin DAB* substance/substance group, the following information is displayed to the user:

*no information*

### Applicable documents

978-3-7692-7517-9 *European Pharmacopoeia 10th Edition, Basic Version 2020* [3]  
Komm2.2.40 *Erfüllung von Ph. Eur. 2.2.40 durch Apo-Ident* [4]  
AA004 *Erstellung und Validierung eines IdentModul-Updates*

### Validation method

Validation is performed after every change to the chemometric model (also “database”) in three steps:

1. The chemometric model is calculated from the calibration spectra using a *PCA algorithm*. The calibration spectra originate from the calibration samples of all substances in this class.
2. In the *chemometric model* generated, the distances between all separable substances are checked for compliance with the specified safety distances.
3. All spectra are presented to the generated chemometric model for evaluation. In three runs, the reference spectra (*Type A*), spectra from independent samples (*Type B*), and spectra from the field (*Type C*) are presented successively. Here, no single *false positive* result is permitted.

Finally, a report is generated from the validation run results and is archived together with the parameters of the model generation in audit-compliant manner.

### Number of independent samples (batches) in calibration and validation

A sample is considered independent if no sample from the same batch has been included in the calibration of the chemometric model.

| Substance/substance group | Type A | Type B | Type C |
|---------------------------|--------|--------|--------|
| Lanolin DAB               | 12     | 25     | 504    |

## Second-stage model

For differentiation of the substance/substance group *Lanolin DAB* the following second-stage model is used:

*no second-stage model*

## Calibration samples

Only spectra which have been recorded by *HiperScan GmbH* from traceable samples are used for the generation of the [chemometric models](#). The following samples have been obtained from the substance/substance group *Lanolin DAB*:

| Supplier      | Substance   | Batch            | Sample ID | Spectra | Certificate        |

## Validation samples

A total of 396 793 spectra were provided for validation. The results were evaluated separately according to the following sample categories:

### Type A All calibration spectra.

- 570 spectra of 12 reference samples from the substance/substance group *Lanolin DAB*. These samples are listed above in the [calibration samples](#) section. The reference samples come from 12 different batches.
- 63 369 spectra from a total of 1295 batches from further 223 substances. These spectra were recorded by *HiperScan GmbH*. *Type A* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type A* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix A](#). The samples in [Appendix A](#) were added for model generation not with the intention to have the model identify these substances, but with the intention to make the model reject them despite their similarity to substances identifiable.

### Type B Spectra from independent samples not included in the database structure. Measurement is carried out by *HiperScan GmbH*.

Samples from batches of which no spectra have been included in the database structure are considered as independent samples. The number of batches from which independent samples supplied *Type B* spectra for validation is shown below, representing the number of independent *Type B* samples. Samples, of which some of the spectra have been included in the database structure and other spectra in the validation, are marked with a <sup>†</sup>. The following applies to the remaining unmarked samples:

\*The spectra were taken from a part of the same sample which the supplier used for its analysis (identity, purity, content). In this case the manufacturer certificates proof the identity and quality of the sample from those the spectra descend.

In the same batch, there was at least one additional sample (other sales container, other sample ID) from which reference spectra (*Type A*) were included in the database structure.

- 1030 spectra of 25 reference samples from the substance/substance group *Lanolin DAB*.
- Among them are spectra of independent samples from 25 batches from which no spectra have been included in the database structure. They are sorted upwards in the following table and separated from the additional samples by a line.

| Supplier      | Substance   | Batch    | Sample ID | Spectra |
|---------------|-------------|----------|-----------|---------|
| Caelo         | Lanolin DAB | 163022   | 32859     | 40      |
| Caelo         | Lanolin DAB | 163023   | 32860     | 40      |
| Caelo         | Lanolin DAB | 163024   | 32861     | 40      |
| Caelo         | Lanolin DAB | 163025   | 32862     | 40      |

| Caelo         | Lanolin DAB | 21000936 | 35374     | 40      |
| Caelo         | Lanolin DAB | 21001189 | 35375     | 40      |
| Caelo         | Lanolin DAB | 21002198 | 35644     | 50      |
| Caelo         | Lanolin DAB | 21002199 | 35645     | 50      |
| Caelo         | Lanolin DAB | 21002476 | 35646     | 50      |
| Henry Lamotte | Lanolin DAB | 5264900  | 30922     | 40      |

- 90 461 spectra from a total of 1991 batches from further 345 substances. These spectra were recorded by *HiperScan GmbH*. *Type B* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type B* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix B](#).

**Type C** Spectra of independent samples not included in the database structure. *Apo-Ident* customers carry out the measurements. *HiperScan GmbH* generally does not verify the information provided by the customer regarding manufacturer and batch number.

- 4710 spectra from 848 *Apo-Ident* customers from 526 batches from the substance/substance group *Lanolin DAB*.
- Among them are spectra of independent samples from 502 batches from which no spectra have been included in the database structure. These are sorted upwards in the following table.

| Supplier   | Substance   | Batch    | Spectra |
|------------|-------------|----------|---------|
| Caelo      | Lanolin DAB | 1974001  | 1       |

- 236 653 spectra from 1121 *Apo-Ident* customers from a total of 46 491 batches from a further 342 substances. These spectra were recorded by *Apo-Ident* customers. *Type C* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type C* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix C](#).

## Validation results

The validation runs checked whether the substance/substance group *Lanolin DAB* can clearly be distinguished from all other substances using NIR spectroscopy with *Apo-Ident*. For this purpose, all relevant spectra of the various substances were compared with *Lanolin DAB* and it was evaluated how many matches (positive) and rejections (negative) were correct or incorrect. The following table breaks down the numbers of correct and incorrect results according to the expected result (*positive/negative*) and the validation spectrum type (*A/B/C*).

|        | False positive | True positive | False negative | True negative |
|--------|----------------|---------------|----------------|---------------|
| Type A | 0              | 560           | 10             | 63 369        |
| Type B | 0              | 1030          | 0              | 90 421        |
| Type C | 0              | 4544          | 166            | 236 653       |

The substance/substance group *Lanolin DAB* can be clearly distinguished from all other substances. In order to make these figures comparable, the weighted *true negative rate (specificity)* and the weighted *true positive rate (recognition rate)* are determined:

|               | <b>Specificity</b>       | <b>Recognition rate</b>  |
|---------------|--------------------------|--------------------------|
| <b>Type A</b> | 100.0000 % (> 99.9797 %) | 98.2456 % (> 97.7193 %)  |
| <b>Type B</b> | 100.0000 % (> 99.9656 %) | 100.0000 % (> 99.4175 %) |
| <b>Type C</b> | 100.0000 % (> 99.6849 %) | 96.4756 % (> 96.4119 %)  |

In order to ensure that each substance is entered with the same weight irrespective of the number of spectra available, each spectrum is weighted with the reciprocal value of its number. (If several new spectra of a substance with a very distinctive spectrum are added, the values for *specificity* and *recognition rate* are safer, but are by no means idealised.)

In order to illustrate the impact of the number of spectra, a comparison is made in parentheses as to how the *specificity* or *recognition rate* would worsen if three additional incorrect results were to exist amongst the spectra (*Rule of Three* [10, 11]). The larger the number of spectra, the lower the deterioration if the three hypothetical *incorrect results* were added.

Where the number of spectra does not exceed 20, no *recognition rate* is provided.

### Nearest chemometric neighbours

The following table lists the closest chemometric neighbours of the substance/substance group *Lanolin DAB* in the substance class *APIs & excipients, liquid/semi-solid (with analysis certificate)*. Furthermore, their *Mahalanobis distance* is specified within the main model and, where appropriate, within the second-stage model.

| <b>Substance</b>                        | <b>Distance in main model</b> | <b>Distance in second-stage model</b> |
|-----------------------------------------|-------------------------------|---------------------------------------|
| Cooling cream DAB                       | 18.90                         | —                                     |
| Cooling ointment DAB 6                  | 34.92                         | —                                     |
| Basis Cordes <sup>®</sup> RK            | 41.65                         | —                                     |
| Clotrimazole 10% Cordes <sup>®</sup> RK | 59.92                         | —                                     |

The list stops after the first substance with a *Mahalanobis distance* greater than 50. If the substance/substance group *Lanolin DAB* is separated from critical neighbours in a second-stage model, all the remaining substances in the second-stage model follow.

### Identity according to identity test using NIR spectroscopy

For each substance, a certificate of the correct identity is obtained from an independent GMP-certified test laboratory. If the identity of the sample can be provided using NIR on an independently tested reference sample, in the following table the *Mahalanobis distance* to the reference sample is specified as well as the *Mahalanobis distance* to the next non-identical substance:

| <b>Sample ID</b> | <b>Reference sample ID</b> | <b>Distance to reference sample</b> | <b>Distance to next foreign sample</b> |
|------------------|----------------------------|-------------------------------------|----------------------------------------|
| 31003            | 32863                      | 10.36                               | 25.31                                  |
| 31439            | 31439                      | 0.00                                | 36.94                                  |
| 31746            | 31794                      | 3.64                                | 26.51                                  |
| 31794            | 31794                      | 0.00                                | 26.09                                  |
| 31795            | 31794                      | 2.04                                | 26.93                                  |
| 31798            | 31794                      | 4.10                                | 27.69                                  |
| 32863            | 32863                      | 0.00                                | 27.57                                  |
| 34518            | 31794                      | 9.08                                | 22.53                                  |
| 34597            | 31794                      | 2.75                                | 22.50                                  |
| 34686            | 31794                      | 4.23                                | 24.87                                  |
| 35373            | 35373                      | 0.00                                | 21.72                                  |
| 35643            | 35643                      | 0.00                                | 24.77                                  |

The identity of a sample will be confirmed by NIR if the distance to the next foreign sample is at least 50 % greater than the distance to a reference sample whose identity has been established by laboratory testing. This criterion is always considered in the chemometric model, which contains all substances of the substance class, even if a second-stage dissolves a subgroup of similar substances, thereby increasing the distances between them. The samples confirmed by NIR support the statistical variance of the original reference substance, but cannot add new aspects or forms of the substance.

# VALIDATION REPORT

### Validation method

Validation is performed after every change to the chemometric model (also “database”) in three steps:

1. The chemometric model is calculated from the calibration spectra using a *PCA algorithm*. The calibration spectra originate from the calibration samples of all substances in this class.
2. In the *chemometric model* generated, the distances between all separable substances are checked for compliance with the specified safety distances.
3. All spectra are presented to the generated chemometric model for evaluation. In three runs, the reference spectra (*Type A*), spectra from independent samples (*Type B*), and spectra from the field (*Type C*) are presented successively. Here, no single *false positive* result is permitted.

Finally, a report is generated from the validation run results and is archived together with the parameters of the model generation in audit-compliant manner.

### Number of independent samples (batches) in calibration and validation

A sample is considered independent if no sample from the same batch has been included in the calibration of the chemometric model.

| Substance/substance group     | Type A | Type B | Type C |
|-------------------------------|--------|--------|--------|
| Lavender oil / Clary sage oil | 15     | 13     | 466    |

## Second-stage model

For differentiation of the substance/substance group *Lavender oil* / *Clary sage oil* the following second-stage model is used:

*no second-stage model*

## Calibration samples

Only spectra which have been recorded by *HiperScan GmbH* from traceable samples are used for the generation of the [chemometric models](#). The following samples have been obtained from the substance/substance group *Lavender oil* / *Clary sage oil*:

| Supplier | Substance      | Batch            | Sample ID | Spectra | Certificate        |
|----------|----------------|------------------|-----------|---------|--------------------|
| Caelo    | Clary sage oil | 13334802         | 31413     | 40      | 1509218            |

## Validation samples

A total of 396 793 spectra were provided for validation. The results were evaluated separately according to the following sample categories:

**Type A** All calibration spectra.

- 680 spectra of 15 reference samples from the substance/substance group *Lavender oil* / *Clary sage oil*. These samples are listed above in the [calibration samples](#) section. The reference samples come from 15 different batches.
- 63 259 spectra from a total of 1292 batches from further 222 substances. These spectra were recorded by *HiperScan GmbH*. *Type A* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type A* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix A](#). The samples in [Appendix A](#) were added for model generation not with the intention to have the model identify these substances, but with the intention to make the model reject them despite their similarity to substances identifiable.

**Type B** Spectra from independent samples not included in the database structure. Measurement is carried out by *HiperScan GmbH*.

Samples from batches of which no spectra have been included in the database structure are considered as independent samples. The number of batches from which independent samples supplied

\*The spectra were taken from a part of the same sample which the supplier used for its analysis (identity, purity, content). In this case the manufacturer certificates proof the identity and quality of the sample from those the spectra descend.

*Type B* spectra for validation is shown below, representing the number of independent *Type B* samples. Samples, of which some of the spectra have been included in the database structure and other spectra in the validation, are marked with a <sup>†</sup>. The following applies to the remaining unmarked samples: In the same batch, there was at least one additional sample (other sales container, other sample ID) from which reference spectra (*Type A*) were included in the database structure.

- 520 spectra of 13 reference samples from the substance/substance group *Lavender oil / Clary sage oil*.
- Among them are spectra of independent samples from 13 batches from which no spectra have been included in the database structure. They are sorted upwards in the following table and separated from the additional samples by a line.

| Supplier | Substance      | Batch    | Sample ID | Spectra |
|----------|----------------|----------|-----------|---------|
| Caelo    | Clary sage oil | 16269902 | 33281     | 40      |
| Caelo    | Clary sage oil | 171087   | 33911     | 40      |
| Caelo    | Lavender oil   | 162922   | 32684     | 40      |
| Caelo    | Lavender oil   | 191847   | 34612     | 40      |
| Caelo    | Lavender oil   | 192713   | 34724     | 40      |
| Euro OTC | Lavender oil   | 1601053  | 31997     | 40      |
| Euro OTC | Lavender oil   | 1606004  | 32458     | 40      |
| Euro OTC | Lavender oil   | 1610029  | 32834     | 40      |
| Euro OTC | Lavender oil   | 1701005  | 32986     | 40      |
| Euro OTC | Lavender oil   | 1706003  | 33597     | 40      |
| Euro OTC | Lavender oil   | 1710038  | 33846     | 40      |
| Euro OTC | Lavender oil   | 1808034  | 34213     | 40      |
| Euro OTC | Lavender oil   | 2004016  | 35061     | 40      |

- 90 971 spectra from a total of 2003 batches from further 344 substances. These spectra were recorded by *HiperScan GmbH*. *Type B* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type B* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix B](#).

**Type C** Spectra of independent samples not included in the database structure. *Apo-Ident* customers carry out the measurements. *HiperScan GmbH* generally does not verify the information provided by the customer regarding manufacturer and batch number.

- 1664 spectra from 486 *Apo-Ident* customers from 479 batches from the substance/substance group *Lavender oil / Clary sage oil*.
- Among them are spectra of independent samples from 462 batches from which no spectra have been included in the database structure. These are sorted upwards in the following table.

| Supplier                 | Substance      | Batch       | Spectra |

- 239 699 spectra from 1121 *Apo-Ident* customers from a total of 46 534 batches from a further 341 substances. These spectra were recorded by *Apo-Ident* customers. *Type C* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type C* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix C](#).

## Validation results

The validation runs checked whether the substance/substance group *Lavender oil / Clary sage oil* can clearly be distinguished from all other substances using NIR spectroscopy with *Apo-Ident*. For this purpose, all relevant spectra of the various substances were compared with *Lavender oil / Clary sage oil* and it was evaluated how many matches (positive) and rejections (negative) were correct or incorrect. The following table breaks down the numbers of correct and incorrect results according to the expected result (*positive/negative*) and the validation spectrum type (*A/B/C*).

|        | False positive | True positive | False negative | True negative |
|--------|----------------|---------------|----------------|---------------|
| Type A | 0              | 680           | 0              | 63 259        |
| Type B | 0              | 520           | 0              | 90 971        |
| Type C | 0              | 1637          | 27             | 239 699       |

The substance/substance group *Lavender oil / Clary sage oil* can be clearly distinguished from all other substances. In order to make these figures comparable, the weighted *true negative rate* (*specificity*) and the weighted *true positive rate* (*recognition rate*) are determined:

|        | Specificity              | Recognition rate         |
|--------|--------------------------|--------------------------|
| Type A | 100.0000 % (> 99.9797 %) | 100.0000 % (> 99.1176 %) |
| Type B | 100.0000 % (> 99.9656 %) | 100.0000 % (> 98.8462 %) |
| Type C | 100.0000 % (> 99.6849 %) | 98.3774 % (> 98.1971 %)  |

In order to ensure that each substance is entered with the same weight irrespective of the number of spectra available, each spectrum is weighted with the reciprocal value of its number. (If several new spectra of a substance with a very distinctive spectrum are added, the values for *specificity* and *recognition rate* are safer, but are by no means idealised.)

In order to illustrate the impact of the number of spectra, a comparison is made in parentheses as to how the *specificity* or *recognition rate* would worsen if three additional incorrect results were to exist amongst the spectra ([Rule of Three](#) [10, 11]). The larger the number of spectra, the lower the deterioration if the three hypothetical *incorrect results* were added.

Where the number of spectra does not exceed 20, no *recognition rate* is provided.

### Nearest chemometric neighbours

The following table lists the closest chemometric neighbours of the substance/substance group *Lavender oil / Clary sage oil* in the substance class *APIs & excipients, liquid/semi-solid (with analysis certificate)*. Furthermore, their *Mahalanobis distance* is specified within the main model and, where appropriate, within the second-stage model.

| Substance     | Distance in<br>main model | Distance in<br>second-stage model |
|---------------|---------------------------|-----------------------------------|
| Coriander oil | 31.84                     | —                                 |
| Bergamot oil  | 45.77                     | —                                 |
| Acorus oil    | 56.45                     | —                                 |

The list stops after the first substance with a *Mahalanobis distance* greater than 50. If the substance/substance group *Lavender oil / Clary sage oil* is separated from critical neighbours in a second-stage model, all the remaining substances in the second-stage model follow.

### Identity according to identity test using NIR spectroscopy

For each substance, a certificate of the correct identity is obtained from an independent GMP-certified test laboratory. If the identity of the sample can be provided using NIR on an independently tested reference sample, in the following table the *Mahalanobis distance* to the reference sample is specified as well as the *Mahalanobis distance* to the next non-identical substance:

| Sample ID | Reference<br>sample ID | Distance to<br>reference sample | Distance to<br>next foreign sample |
|-----------|------------------------|---------------------------------|------------------------------------|
| 30861     | 32710                  | 17.85                           | 57.53                              |
| 31223     | 31223                  | 0.00                            | 57.87                              |
| 31237     | 32710                  | 17.10                           | 64.62                              |
| 31238     | 31721                  | 2.65                            | 55.74                              |
| 31413     | 31413                  | 0.00                            | 72.25                              |
| 31416     | 32710                  | 18.02                           | 59.66                              |
| 31422     | 31223                  | 1.96                            | 58.78                              |
| 31528     | 31528                  | 0.00                            | 62.04                              |
| 31668     | 31413                  | 7.09                            | 70.65                              |
| 31721     | 31721                  | 0.00                            | 59.95                              |
| 31800     | 31800                  | 0.00                            | 58.75                              |
| 32710     | 32710                  | 0.00                            | 59.33                              |
| 32996     | 31721                  | 3.37                            | 51.63                              |
| 35120     | 35120                  | 0.00                            | 58.42                              |
| 35125     | 35125                  | 0.00                            | 58.69                              |

The identity of a sample will be confirmed by NIR if the distance to the next foreign sample is at least 50 % greater than the distance to a reference sample whose identity has been established by laboratory testing. This criterion is always considered in the chemometric model, which contains all substances of the substance class, even if a second-stage dissolves a subgroup of similar substances, thereby increasing the distances between them. The samples confirmed by NIR support the statistical variance of the original reference substance, but cannot add new aspects or forms of the substance.

# VALIDATION REPORT

## IdentModule 2.4-2021-04

Validated substance/substance group **Liniment ointments**  
Substance class APIs & excipients, liquid/semi-solid (with analysis certificate)  
Report date 08/11/2021  
Report number 10002320-2021-11-08  
Executing company HiperScan GmbH  
Weißeritzstraße 3  
01067 Dresden  
Germany

### Relevant substance names

Liniment ointments; Hydrated liniment SR/DAC (NRF p.40); Linimentum aquosum N (NRF S. 39);  
Linimentum aquosum SR/DAC (NRF S.40); Non-ionic hydrous liniment SR/DAC (NRF P. 39)

### Special notes

When selecting the *Liniment ointments* substance/substance group, the following information is displayed to the user:

*no information*

### Applicable documents

978-3-7692-7517-9 *European Pharmacopoeia 10th Edition, Basic Version 2020* [3]  
Komm2.2.40 *Erfüllung von Ph. Eur. 2.2.40 durch Apo-Ident* [4]  
AA004 *Erstellung und Validierung eines IdentModul-Updates*

### Validation method

Validation is performed after every change to the chemometric model (also “database”) in three steps:

1. The chemometric model is calculated from the calibration spectra using a *PCA algorithm*. The calibration spectra originate from the calibration samples of all substances in this class.
2. In the *chemometric model* generated, the distances between all separable substances are checked for compliance with the specified safety distances.
3. All spectra are presented to the generated chemometric model for evaluation. In three runs, the reference spectra (*Type A*), spectra from independent samples (*Type B*), and spectra from the field (*Type C*) are presented successively. Here, no single *false positive* result is permitted.

Finally, a report is generated from the validation run results and is archived together with the parameters of the model generation in audit-compliant manner.

### Number of independent samples (batches) in calibration and validation

A sample is considered independent if no sample from the same batch has been included in the calibration of the chemometric model.

| Substance/substance group | Type A | Type B | Type C |
|---------------------------|--------|--------|--------|
| Liniment ointments        | 19     | 39     | 1488   |

## Second-stage model

For differentiation of the substance/substance group *Liniment ointments* the following second-stage model is used:

*no second-stage model*

## Calibration samples

Only spectra which have been recorded by *HiperScan GmbH* from traceable samples are used for the generation of the [chemometric models](#). The following samples have been obtained from the substance/substance group *Liniment ointments*:

| Supplier    | Substance           | Batch     | Sample ID | Spectra | Certificate |

## Validation samples

A total of 396 793 spectra were provided for validation. The results were evaluated separately according to the following sample categories:

**Type A** All calibration spectra.

- 1040 spectra of 21 reference samples from the substance/substance group *Liniment ointments*. These samples are listed above in the [calibration samples](#) section. The reference samples come from 19 different batches.
- 62 899 spectra from a total of 1288 batches from further 222 substances. These spectra were recorded by *HiperScan GmbH*. *Type A* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type A* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix A](#). The samples in [Appendix A](#) were added for model generation not with the intention to have the model identify these substances, but with the intention to make the model reject them despite their similarity to substances identifiable.

\*The spectra were taken from a part of the same sample which the supplier used for its analysis (identity, purity, content). In this case the manufacturer certificates proof the identity and quality of the sample from those the spectra descend.

**Type B** Spectra from independent samples not included in the database structure. Measurement is carried out by *HiperScan GmbH*.

Samples from batches of which no spectra have been included in the database structure are considered as independent samples. The number of batches from which independent samples supplied *Type B* spectra for validation is shown below, representing the number of independent *Type B* samples. Samples, of which some of the spectra have been included in the database structure and other spectra in the validation, are marked with a <sup>†</sup>. The following applies to the remaining unmarked samples: In the same batch, there was at least one additional sample (other sales container, other sample ID) from which reference spectra (*Type A*) were included in the database structure.

- 2300 spectra of 58 reference samples from the substance/substance group *Liniment ointments*.
- Among them are spectra of independent samples from 39 batches from which no spectra have been included in the database structure. They are sorted upwards in the following table and separated from the additional samples by a line.

| Supplier | Substance                       | Batch     | Sample ID          | Spectra |
|----------|---------------------------------|-----------|--------------------|---------|
| Caelo    | Hydrated liniment SR/DAC (NR... | 161824    | 32395              | 40      |

- 89 191 spectra from a total of 1975 batches from further 344 substances. These spectra were recorded by *HiperScan GmbH*. *Type B* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type B* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix B](#).

**Type C** Spectra of independent samples not included in the database structure. *Apo-Ident* customers carry out the measurements. *HiperScan GmbH* generally does not verify the information provided by the customer regarding manufacturer and batch number.

- 5428 spectra from 756 *Apo-Ident* customers from 1491 batches from the substance/substance group *Liniment ointments*.
- Among them are spectra of independent samples from 1448 batches from which no spectra have been included in the database structure. These are sorted upwards in the following table.

| Supplier                 | Substance                       | Batch     | Spectra |

- 235 935 spectra from 1120 *Apo-Ident* customers from a total of 45 550 batches from a further 341 substances. These spectra were recorded by *Apo-Ident* customers. *Type C* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type C* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix C](#).

## Validation results

The validation runs checked whether the substance/substance group *Liniment ointments* can clearly be distinguished from all other substances using NIR spectroscopy with *Apo-Ident*. For this purpose, all relevant spectra of the various substances were compared with *Liniment ointments* and it was evaluated how many matches (positive) and rejections (negative) were correct or incorrect. The following table breaks down the numbers of correct and incorrect results according to the expected result (*positive/negative*) and the validation spectrum type (*A/B/C*).

|               | False positive | True positive | False negative | True negative |
|---------------|----------------|---------------|----------------|---------------|
| <b>Type A</b> | 0              | 1040          | 0              | 62 899        |
| <b>Type B</b> | 0              | 2296          | 4              | 89 191        |
| <b>Type C</b> | 0              | 5265          | 163            | 235 828       |

The substance/substance group *Liniment ointments* can be clearly distinguished from all other substances. In order to make these figures comparable, the weighted *true negative rate (specificity)* and the weighted *true positive rate (recognition rate)* are determined:

|               | Specificity              | Recognition rate         |
|---------------|--------------------------|--------------------------|
| <b>Type A</b> | 100.0000 % (> 99.9797 %) | 100.0000 % (> 99.4231 %) |
| <b>Type B</b> | 100.0000 % (> 99.9655 %) | 99.8261 % (> 99.6957 %)  |
| <b>Type C</b> | 100.0000 % (> 99.6837 %) | 96.9971 % (> 96.9418 %)  |

In order to ensure that each substance is entered with the same weight irrespective of the number of spectra available, each spectrum is weighted with the reciprocal value of its number. (If several new spectra of a substance with a very distinctive spectrum are added, the values for *specificity* and *recognition rate* are safer, but are by no means idealised.)

In order to illustrate the impact of the number of spectra, a comparison is made in parentheses as to how the *specificity* or *recognition rate* would worsen if three additional incorrect results were to exist amongst the spectra (*Rule of Three* [10, 11]). The larger the number of spectra, the lower the deterioration if the three hypothetical *incorrect results* were added.

Where the number of spectra does not exceed 20, no *recognition rate* is provided.

## Nearest chemometric neighbours

The following table lists the closest chemometric neighbours of the substance/substance group *Liniment ointments* in the substance class *APIs & excipients, liquid/semi-solid (with analysis certificate)*. Furthermore, their *Mahalanobis distance* is specified within the main model and, where appropriate, within the second-stage model.

| Substance                                    | Distance in main model | Distance in second-stage model |
|----------------------------------------------|------------------------|--------------------------------|
| Hydrophilic cream, non-ionic SR (NRF p. ...) | 18.90                  | —                              |
| Hydrophilic cream, non-ionic without p. ...  | 25.37                  | —                              |
| Base cream, hydrophobic DAC                  | 26.95                  | —                              |
| Sodium laureth sulfate solution 27%          | 27.10                  | —                              |
| Anionic hydrophilic cream SR (NRF p.27)      | 28.89                  | —                              |
| Hydrophilic base emulsion (NRF p.25)         | 29.19                  | —                              |
| Anionic hydrophilic cream with propyle. ...  | 29.84                  | —                              |
| Anionic hydrophilic cream DAB                | 32.33                  | —                              |
| Wolff® base half-fat cream                   | 33.92                  | —                              |
| Anionic hydrophlic cream without prese. ...  | 36.14                  | —                              |
| Skin care ointment W/L SR (without pre. ...) | 36.41                  | —                              |
| Sodium lactate solution 50%                  | 37.70                  | —                              |
| Glycolic acid 70%                            | 38.71                  | —                              |
| Base cream, diluted                          | 41.43                  | —                              |
| Lotio Cordes®                                | 43.65                  | —                              |
| Skin care ointment W/L SR                    | 46.66                  | —                              |
| Gel Cordes®                                  | 47.11                  | —                              |
| Fortified wine                               | 53.01                  | —                              |

The list stops after the first substance with a *Mahalanobis distance* greater than 50. If the substance/substance group *Liniment ointments* is separated from critical neighbours in a second-stage model, all the remaining substances in the second-stage model follow.

## Identity according to identity test using NIR spectroscopy

For each substance, a certificate of the correct identity is obtained from an independent GMP-certified test laboratory. If the identity of the sample can be provided using NIR on an independently tested reference sample, in the following table the *Mahalanobis distance* to the reference sample is specified as well as the *Mahalanobis distance* to the next non-identical substance:

| Sample ID | Reference sample ID | Distance to reference sample | Distance to next foreign sample |
|-----------|---------------------|------------------------------|---------------------------------|
| 30982     | 31939               | 7.82                         | 37.11                           |
| 31169     | 31169               | 0.00                         | 36.45                           |
| 31170     | 31170               | 0.00                         | 42.23                           |
| 31438     | 31938               | 3.29                         | 40.55                           |
| 31476     | 31945               | 5.60                         | 40.00                           |

The identity of a sample will be confirmed by NIR if the distance to the next foreign sample is at least 50 % greater than the distance to a reference sample whose identity has been established by laboratory testing. This criterion is always considered in the chemometric model, which contains all substances of the substance class, even if a second-stage dissolves a subgroup of similar substances, thereby increasing the distances between them. The samples confirmed by NIR support the statistical variance of the original reference substance, but cannot add new aspects or forms of the substance.

# VALIDATION REPORT

## IdentModule 2.4-2021-04

Validated substance/substance group **Macrogol 4 lauryl ether / Lauromacrogol 400 / Macrogolglycerol**  
Substance class APIs & excipients, liquid/semi-solid (with analysis certificate)  
Report date 08/11/2021  
Report number 10004572-2021-11-08  
Executing company HiperScan GmbH  
Weißeritzstraße 3  
01067 Dresden  
Germany

### Relevant substance names

Macrogol 4 lauryl ether / Lauromacrogol 400 / Macrogolglycerol hydroxystearate 40; Lauromacrogol 400; Macrogol 4 lauryl ether; Macrogolglycerol hydroxystearate 40; Macrogolglyceroli hydroxystearas; Macrogoli aether laurilicus; Polidocanolum

### Special notes

When selecting the *Macrogol 4 lauryl ether / Lauromacrogol 400 / Macrogolglycerol hydroxystearate 40* substance/substance group, the following information is displayed to the user:

*no information*

### Applicable documents

978-3-7692-7517-9 *European Pharmacopoeia 10th Edition, Basic Version 2020* [3]  
Komm2.2.40 *Erfüllung von Ph. Eur. 2.2.40 durch Apo-Ident* [4]  
AA004 *Erstellung und Validierung eines IdentModul-Updates*

### Validation method

Validation is performed after every change to the chemometric model (also “database”) in three steps:

1. The chemometric model is calculated from the calibration spectra using a *PCA algorithm*. The calibration spectra originate from the calibration samples of all substances in this class.
2. In the *chemometric model* generated, the distances between all separable substances are checked for compliance with the specified safety distances.
3. All spectra are presented to the generated chemometric model for evaluation. In three runs, the reference spectra (*Type A*), spectra from independent samples (*Type B*), and spectra from the field (*Type C*) are presented successively. Here, no single *false positive* result is permitted.

Finally, a report is generated from the validation run results and is archived together with the parameters of the model generation in audit-compliant manner.

### Number of independent samples (batches) in calibration and validation

A sample is considered independent if no sample from the same batch has been included in the calibration of the chemometric model.

| Substance/substance group                     | Type A | Type B | Type C |
|-----------------------------------------------|--------|--------|--------|
| Macrogol 4 lauryl ether / Lauromacrogol 400 / | 17     | 17     | 986    |
| Macrogolglycerol hydroxystearate 40           |        |        |        |

## Second-stage model

For differentiation of the substance/substance group *Macrogol 4 lauryl ether / Lauromacrogol 400 / Macrogolglycerol hydroxystearate 40* the following second-stage model is used:

- [Submodel 10](#)

## Calibration samples

Only spectra which have been recorded by *HiperScan GmbH* from traceable samples are used for the generation of the [chemometric models](#). The following samples have been obtained from the substance/substance group *Macrogol 4 lauryl ether / Lauromacrogol 400 / Macrogolglycerol hydroxystearate 40*:

| Supplier | Substance           | Batch            | Sample ID | Spectra | Certificate        |

## Validation samples

A total of 396 793 spectra were provided for validation. The results were evaluated separately according to the following sample categories:

### Type A All calibration spectra.

- 738 spectra of 17 reference samples from the substance/substance group *Macrogol 4 lauryl ether / Lauromacrogol 400 / Macrogolglycerol hydroxystearate 40*. These samples are listed above in the [calibration samples](#) section. The reference samples come from 17 different batches.
- 63 201 spectra from a total of 1290 batches from further 221 substances. These spectra were recorded by *HiperScan GmbH*. *Type A* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type A* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix A](#). The samples in [Appendix A](#) were added for model generation not with the intention to have the model identify these substances, but with the intention to make the model reject them despite their similarity to substances identifiable.

\*The spectra were taken from a part of the same sample which the supplier used for its analysis (identity, purity, content). In this case the manufacturer certificates proof the identity and quality of the sample from those the spectra descend.

**Type B** Spectra from independent samples not included in the database structure. Measurement is carried out by *HiperScan GmbH*.

Samples from batches of which no spectra have been included in the database structure are considered as independent samples. The number of batches from which independent samples supplied *Type B* spectra for validation is shown below, representing the number of independent *Type B* samples. Samples, of which some of the spectra have been included in the database structure and other spectra in the validation, are marked with a <sup>†</sup>. The following applies to the remaining unmarked samples: In the same batch, there was at least one additional sample (other sales container, other sample ID) from which reference spectra (*Type A*) were included in the database structure.

- 730 spectra of 17 reference samples from the substance/substance group *Macrogol 4 lauryl ether / Lauromacrogol 400 / Macrogolglycerol hydroxystearate 40*.
- Among them are spectra of independent samples from 17 batches from which no spectra have been included in the database structure. They are sorted upwards in the following table and separated from the additional samples by a line.

| Supplier | Substance                       | Batch      | Sample ID | Spectra |
|----------|---------------------------------|------------|-----------|---------|
| Caelo    | Lauromacrogol 400               | 172509     | 33899     | 40      |
| Caelo    | Lauromacrogol 400               | 181755     | 34235     | 40      |
| Caelo    | Lauromacrogol 400               | 191310     | 34630     | 40      |
| Euro OTC | Lauromacrogol 400               | 1703033    | 33448     | 40      |
| Euro OTC | Lauromacrogol 400               | 1710026    | 33844     | 40      |

| Euro OTC | Lauromacrogol 400               | 1911015    | 34749     | 40      |
| Euro OTC | Lauromacrogol 400               | 2003031-01 | 35076     | 40      |
| Euro OTC | Lauromacrogol 400               | 2007042    | 35132     | 40      |
| Euro OTC | Lauromacrogol 400               | 2106011    | 35627     | 50      |
| Caelo    | Macrogol 4 lauryl ether         | 161002     | 33690     | 40      |
| Caelo    | Macrogol 4 lauryl ether         | 17028303   | 33950     | 40      |
| Caelo    | Macrogolglycerol hydroxystea... | 14283805   | 31608     | 60      |
| Caelo    | Macrogolglycerol hydroxystea... | 16349304   | 33935     | 40      |
| Fagron   | Macrogolglycerol hydroxystea... | 14K28-B01  | 31640     | 60      |

- 90 761 spectra from a total of 1999 batches from further 343 substances. These spectra were recorded by *HiperScan GmbH*. *Type B* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type B* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix B](#).

**Type C** Spectra of independent samples not included in the database structure. *Apo-Ident* customers carry out the measurements. *HiperScan GmbH* generally does not verify the information provided by the customer regarding manufacturer and batch number.

- 6506 spectra from 959 *Apo-Ident* customers from 978 batches from the substance/substance group *Macrogol 4 lauryl ether / Lauromacrogol 400 / Macrogolglycerol hydroxystearate 40*.
- Among them are spectra of independent samples from 915 batches from which no spectra have been included in the database structure. These are sorted upwards in the following table.

| Supplier      | Substance         | Batch          | Spectra |
|---------------|-------------------|----------------|---------|
| /Sanacorp     | Lauromacrogol 400 | 160312         | 1       |

- 234857 spectra from 1121 *Apo-Ident* customers from a total of 46 042 batches from a further 340 substances. These spectra were recorded by *Apo-Ident* customers. *Type C* samples are docu-

mented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type C* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix C](#).

## Validation results

The validation runs checked whether the substance/substance group *Macrogol 4 lauryl ether / Lauromacrogol 400 / Macrogolglycerol hydroxystearate 40* can clearly be distinguished from all other substances using NIR spectroscopy with *Apo-Ident*. For this purpose, all relevant spectra of the various substances were compared with *Macrogol 4 lauryl ether / Lauromacrogol 400 / Macrogolglycerol hydroxystearate 40* and it was evaluated how many matches (positive) and rejections (negative) were correct or incorrect. The following table breaks down the numbers of correct and incorrect results according to the expected result (*positive/negative*) and the validation spectrum type (*A/B/C*).

|               | False positive | True positive | False negative | True negative |
|---------------|----------------|---------------|----------------|---------------|
| <b>Type A</b> | 0              | 738           | 0              | 63 201        |
| <b>Type B</b> | 0              | 728           | 2              | 90 668        |
| <b>Type C</b> | 0              | 5931          | 575            | 234 857       |

The substance/substance group *Macrogol 4 lauryl ether / Lauromacrogol 400 / Macrogolglycerol hydroxystearate 40* can be clearly distinguished from all other substances. In order to make these figures comparable, the weighted *true negative rate* (*specificity*) and the weighted *true positive rate* (*recognition rate*) are determined:

|               | Specificity              | Recognition rate         |
|---------------|--------------------------|--------------------------|
| <b>Type A</b> | 100.0000 % (> 99.9797 %) | 100.0000 % (> 99.1870 %) |
| <b>Type B</b> | 100.0000 % (> 99.9655 %) | 99.7260 % (> 99.3151 %)  |
| <b>Type C</b> | 100.0000 % (> 99.6849 %) | 91.1620 % (> 91.1159 %)  |

In order to ensure that each substance is entered with the same weight irrespective of the number of spectra available, each spectrum is weighted with the reciprocal value of its number. (If several new spectra of a substance with a very distinctive spectrum are added, the values for *specificity* and *recognition rate* are safer, but are by no means idealised.)

In order to illustrate the impact of the number of spectra, a comparison is made in parentheses as to how the *specificity* or *recognition rate* would worsen if three additional incorrect results were to exist amongst the spectra ([Rule of Three](#) [10, 11]). The larger the number of spectra, the lower the deterioration if the three hypothetical *incorrect results* were added.

Where the number of spectra does not exceed 20, no *recognition rate* is provided.

## Nearest chemometric neighbours

The following table lists the closest chemometric neighbours of the substance/substance group *Macrogol 4 lauryl ether / Lauromacrogol 400 / Macrogolglycerol hydroxystearate 40* in the substance class *APIs & excipients, liquid/semi-solid (with analysis certificate)*. Furthermore, their *Mahalanobis distance* is specified within the main model and, where appropriate, within the second-stage model.

| Substance                                 | Distance in main model | Distance in second-stage model |
|-------------------------------------------|------------------------|--------------------------------|
| Polysorbate 60                            | 7.35                   | 14.57                          |
| Macrogol 20 glycerol monostearate type... | 8.73                   | 22.20                          |
| Polysorbate 20                            | 13.88                  | 32.94                          |
| Macrogol-2-laurylether                    | 15.08                  | —                              |
| Macrogol 8 stearate type I                | 18.21                  | 22.63                          |
| Polysorbate 80                            | 18.98                  | 28.59                          |
| Macrogol ointment                         | 20.97                  | —                              |
| Polyol fatty acid ester                   | 21.50                  | —                              |
| Macrogolglycerol ricinoleate              | 26.66                  | 28.35                          |
| Macrogols 400                             | 48.02                  | —                              |
| Hydrophilic ointment DAB                  | 56.17                  | —                              |

The list stops after the first substance with a *Mahalanobis distance* greater than 50. If the substance/substance group *Macrogol 4 lauryl ether / Lauromacrogol 400 / Macrogolglycerol hydroxystearate 40* is separated from critical neighbours in a second-stage model, all the remaining substances in the second-stage model follow.

#### Identity according to identity test using NIR spectroscopy

For each substance, a certificate of the correct identity is obtained from an independent GMP-certified test laboratory. If the identity of the sample can be provided using NIR on an independently tested reference sample, in the following table the *Mahalanobis distance* to the reference sample is specified as well as the *Mahalanobis distance* to the next non-identical substance:

| Sample ID | Reference sample ID | Distance to reference sample | Distance to next foreign sample |
|-----------|---------------------|------------------------------|---------------------------------|
| 30594     | 32283               | 2.84                         | 18.77                           |
| 30765     | 30765               | 0.00                         | 22.33                           |
| 31025     | 32283               | 2.01                         | 18.89                           |
| 31372     | 31372               | 0.00                         | 24.54                           |
| 31381     | 31381               | 0.00                         | 21.08                           |
| 31583     | 31381               | 6.80                         | 21.13                           |
| 31625     | 31625               | 0.00                         | 26.85                           |
| 31768     | 31768               | 0.00                         | 20.80                           |
| 32283     | 32283               | 0.00                         | 22.27                           |
| 32816     | 32816               | 0.00                         | 12.75                           |
| 32824     | 32816               | 8.07                         | 12.70                           |
| 33216     | 31381               | 7.84                         | 19.54                           |
| 35020     | 35020               | 0.00                         | 24.64                           |
| 35140     | 31625               | 3.13                         | 23.81                           |
| 35141     | 31381               | 10.69                        | 19.92                           |
| 35150     | 31768               | 1.99                         | 17.96                           |
| 35464     | 31625               | 6.69                         | 22.98                           |

The identity of a sample will be confirmed by NIR if the distance to the next foreign sample is at least 50% greater than the distance to a reference sample whose identity has been established by laboratory testing. This criterion is always considered in the chemometric model, which contains all substances of the substance class, even if a second-stage dissolves a subgroup of similar substances, thereby increasing the distances between them. The samples confirmed by NIR support the statistical variance of the original reference substance, but cannot add new aspects or forms of the substance.

# VALIDATION REPORT

## IdentModule 2.4-2021-04

Validated substance/substance group **Macrogol 8 stearate type I**  
Substance class APIs & excipients, liquid/semi-solid (with analysis certificate)  
Report date 08/11/2021  
Report number 30554-2021-11-08  
Executing company HiperScan GmbH  
Weißeritzstraße 3  
01067 Dresden  
Germany

### Relevant substance names

Macrogol 8 stearate type I; Polyäthylenglycol-8-stearat

### Special notes

When selecting the *Macrogol 8 stearate type I* substance/substance group, the following information is displayed to the user:

*no information*

### Applicable documents

978-3-7692-7517-9 *European Pharmacopoeia 10th Edition, Basic Version 2020* [3]  
Komm2.2.40 *Erfüllung von Ph. Eur. 2.2.40 durch Apo-Ident* [4]  
AA004 *Erstellung und Validierung eines IdentModul-Updates*

### Validation method

Validation is performed after every change to the chemometric model (also “database”) in three steps:

1. The chemometric model is calculated from the calibration spectra using a *PCA algorithm*. The calibration spectra originate from the calibration samples of all substances in this class.
2. In the *chemometric model* generated, the distances between all separable substances are checked for compliance with the specified safety distances.
3. All spectra are presented to the generated chemometric model for evaluation. In three runs, the reference spectra (*Type A*), spectra from independent samples (*Type B*), and spectra from the field (*Type C*) are presented successively. Here, no single *false positive* result is permitted.

Finally, a report is generated from the validation run results and is archived together with the parameters of the model generation in audit-compliant manner.

### Number of independent samples (batches) in calibration and validation

A sample is considered independent if no sample from the same batch has been included in the calibration of the chemometric model.

| Substance/substance group  | Type A | Type B | Type C |
|----------------------------|--------|--------|--------|
| Macrogol 8 stearate type I | 6      | 2      | 47     |

## Second-stage model

For differentiation of the substance/substance group *Macrogol 8 stearate type I* the following second-stage model is used:

- [Submodel 10](#)

## Calibration samples

Only spectra which have been recorded by *HiperScan GmbH* from traceable samples are used for the generation of the [chemometric models](#). The following samples have been obtained from the substance/substance group *Macrogol 8 stearate type I*:

| Supplier | Substance           | Batch    | Sample ID | Spectra | Certificate        |
|----------|---------------------|----------|-----------|---------|--------------------|
| Caelo    | Macrogol 8 stere... | 13077501 | 31165     | 40      | 1407187            |
| Caelo    | Macrogol 8 stere... | 13324506 | 31453     | 40      | AR-15-FG-001640-01 |
| Caelo    | Macrogol 8 stere... | 172186   | 33717     | 40      | 20170906*          |
| Caelo    | Macrogol 8 stere... | 173095   | 33900     | 40      | 20180111*          |
| Caelo    | Macrogol 8 stere... | 192346   | 34708     | 40      | 20191010*          |
| Caelo    | Macrogol 8 stere... | 20004032 | 35278     | 40      | 20210205*          |

## Validation samples

A total of 396 793 spectra were provided for validation. The results were evaluated separately according to the following sample categories:

### Type A All calibration spectra.

- 240 spectra of 6 reference samples from the substance/substance group *Macrogol 8 stearate type I*. These samples are listed above in the [calibration samples](#) section. The reference samples come from 6 different batches.
- 63 699 spectra from a total of 1301 batches from further 223 substances. These spectra were recorded by *HiperScan GmbH*. *Type A* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type A* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix A](#). The samples in [Appendix A](#) were added for model generation not with the intention to have the model identify these substances, but with the intention to make the model reject them despite their similarity to substances identifiable.

**Type B** Spectra from independent samples not included in the database structure. Measurement is carried out by *HiperScan GmbH*.

Samples from batches of which no spectra have been included in the database structure are considered as independent samples. The number of batches from which independent samples supplied *Type B* spectra for validation is shown below, representing the number of independent *Type B* samples. Samples, of which some of the spectra have been included in the database structure and other spectra in the validation, are marked with a <sup>†</sup>. The following applies to the remaining unmarked samples: In the same batch, there was at least one additional sample (other sales container, other sample ID) from which reference spectra (*Type A*) were included in the database structure.

- 120 spectra of 3 reference samples from the substance/substance group *Macrogol 8 stearate type I*.

\*The spectra were taken from a part of the same sample which the supplier used for its analysis (identity, purity, content). In this case the manufacturer certificates proof the identity and quality of the sample from those the spectra descend.

- Among them are spectra of independent samples from 2 batches from which no spectra have been included in the database structure. They are sorted upwards in the following table and separated from the additional samples by a line.

| Supplier | Substance                  | Batch  | Sample ID | Spectra |
|----------|----------------------------|--------|-----------|---------|
| Caelo    | Macrogol 8 stereate type I | 162302 | 32339     | 40      |
| Caelo    | Macrogol 8 stereate type I | 182402 | 34339     | 40      |
| Caelo    | Macrogol 8 stereate type I | 162302 | 32701     | 40      |

- 91371 spectra from a total of 2014 batches from further 345 substances. These spectra were recorded by *HiperScan GmbH*. *Type B* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type B* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix B](#).

**Type C** Spectra of independent samples not included in the database structure. *Apo-Ident* customers carry out the measurements. *HiperScan GmbH* generally does not verify the information provided by the customer regarding manufacturer and batch number.

- 171 spectra from 98 *Apo-Ident* customers from 48 batches from the substance/substance group *Macrogol 8 stereate type I*.
- Among them are spectra of independent samples from 47 batches from which no spectra have been included in the database structure. These are sorted upwards in the following table.

| Supplier  | Substance                  | Batch              | Spectra |

- 241 192 spectra from 1121 *Apo-Ident* customers from a total of 46 958 batches from a further 342 substances. These spectra were recorded by *Apo-Ident* customers. *Type C* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type C* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix C](#).

## Validation results

The validation runs checked whether the substance/substance group *Macrogol 8 stereate type I* can clearly be distinguished from all other substances using NIR spectroscopy with *Apo-Ident*. For this purpose, all relevant spectra of the various substances were compared with *Macrogol 8 stereate type I* and it was evaluated how many matches (positive) and rejections (negative) were correct or incorrect. The following table breaks down the numbers of correct and incorrect results according to the expected result (*positive/negative*) and the validation spectrum type (*A/B/C*).

|        | False positive | True positive | False negative | True negative |
|--------|----------------|---------------|----------------|---------------|
| Type A | 0              | 240           | 0              | 63 699        |
| Type B | 0              | 120           | 0              | 91 371        |
| Type C | 0              | 164           | 7              | 241 192       |

The substance/substance group *Macrogol 8 stearate type I* can be clearly distinguished from all other substances. In order to make these figures comparable, the weighted *true negative rate (specificity)* and the weighted *true positive rate (recognition rate)* are determined:

|               | <b>Specificity</b>       | <b>Recognition rate</b>  |
|---------------|--------------------------|--------------------------|
| <b>Type A</b> | 100.0000 % (> 99.9798 %) | 100.0000 % (> 97.5000 %) |
| <b>Type B</b> | 100.0000 % (> 99.9656 %) | 100.0000 % (> 95.0000 %) |
| <b>Type C</b> | 100.0000 % (> 99.6849 %) | 95.9064 % (> 94.1520 %)  |

In order to ensure that each substance is entered with the same weight irrespective of the number of spectra available, each spectrum is weighted with the reciprocal value of its number. (If several new spectra of a substance with a very distinctive spectrum are added, the values for *specificity* and *recognition rate* are safer, but are by no means idealised.)

In order to illustrate the impact of the number of spectra, a comparison is made in parentheses as to how the *specificity* or *recognition rate* would worsen if three additional incorrect results were to exist amongst the spectra (*Rule of Three* [10, 11]). The larger the number of spectra, the lower the deterioration if the three hypothetical *incorrect results* were added.

Where the number of spectra does not exceed 20, no *recognition rate* is provided.

### Nearest chemometric neighbours

The following table lists the closest chemometric neighbours of the substance/substance group *Macrogol 8 stearate type I* in the substance class *APIs & excipients, liquid/semi-solid (with analysis certificate)*. Furthermore, their *Mahalanobis distance* is specified within the main model and, where appropriate, within the second-stage model.

| <b>Substance</b>                          | <b>Distance in main model</b> | <b>Distance in second-stage model</b> |
|-------------------------------------------|-------------------------------|---------------------------------------|
| Polysorbate 60                            | 9.31                          | 14.19                                 |
| Macrogol 20 glycerol monostearate type... | 20.51                         | 22.57                                 |
| Macrogolglycerol hydroxystearate 40       | 22.53                         | 35.74                                 |
| Lauromacrogol 400                         | 22.64                         | 23.99                                 |
| Macrogol ointment                         | 26.12                         | —                                     |
| Polysorbate 80                            | 28.20                         | 29.65                                 |
| Polysorbate 20                            | 28.37                         | 56.50                                 |
| Polyol fatty acid ester                   | 28.58                         | —                                     |
| Macrogolglycerol ricinoleate              | 28.92                         | 41.78                                 |
| Pasta Cordes®                             | 37.93                         | —                                     |
| Macrogol 4 lauryl ether                   | 39.10                         | 37.09                                 |
| Soft ointment                             | 40.59                         | —                                     |
| Hydrophilic ointment DAB                  | 42.23                         | —                                     |
| Macrogol-2-laurylether                    | 43.84                         | —                                     |
| Macrogols 300                             | 46.95                         | —                                     |

The list stops after the first substance with a *Mahalanobis distance* greater than 50. If the substance/substance group *Macrogol 8 stearate type I* is separated from critical neighbours in a second-stage model, all the remaining substances in the second-stage model follow.

### Identity according to identity test using NIR spectroscopy

For each substance, a certificate of the correct identity is obtained from an independent GMP-certified test laboratory. If the identity of the sample can be provided using NIR on an independently tested reference sample, in the following table the *Mahalanobis distance* to the reference sample is specified as well as the *Mahalanobis distance* to the next non-identical substance:

| Sample ID | Reference sample ID | Distance to reference sample | Distance to next foreign sample |
|-----------|---------------------|------------------------------|---------------------------------|
| 31165     | 31165               | 0.00                         | 26.40                           |
| 31453     | 31453               | 0.00                         | 29.72                           |
| 33717     | 33717               | 0.00                         | 32.69                           |
| 33900     | 33900               | 0.00                         | 25.57                           |
| 34708     | 34708               | 0.00                         | 31.74                           |
| 35278     | 35278               | 0.00                         | 29.23                           |

The identity of a sample will be confirmed by NIR if the distance to the next foreign sample is at least 50 % greater than the distance to a reference sample whose identity has been established by laboratory testing. This criterion is always considered in the chemometric model, which contains all substances of the substance class, even if a second-stage dissolves a subgroup of similar substances, thereby increasing the distances between them. The samples confirmed by NIR support the statistical variance of the original reference substance, but cannot add new aspects or forms of the substance.

# VALIDATION REPORT

## IdentModule 2.4-2021-04

Validated substance/substance group **Macrogol ointment**  
Substance class APIs & excipients, liquid/semi-solid (with analysis certificate)  
Report date 08/11/2021  
Report number 30465-2021-11-08  
Executing company HiperScan GmbH  
Weißeritzstraße 3  
01067 Dresden  
Germany

### Relevant substance names

Macrogol ointment; Unguentum polyäthylenglycoli

### Special notes

When selecting the *Macrogol ointment* substance/substance group, the following information is displayed to the user:

*no information*

### Applicable documents

978-3-7692-7517-9 *European Pharmacopoeia 10th Edition, Basic Version 2020* [3]  
Komm2.2.40 *Erfüllung von Ph. Eur. 2.2.40 durch Apo-Ident* [4]  
AA004 *Erstellung und Validierung eines IdentModul-Updates*

### Validation method

Validation is performed after every change to the chemometric model (also “database”) in three steps:

1. The chemometric model is calculated from the calibration spectra using a *PCA algorithm*. The calibration spectra originate from the calibration samples of all substances in this class.
2. In the *chemometric model* generated, the distances between all separable substances are checked for compliance with the specified safety distances.
3. All spectra are presented to the generated chemometric model for evaluation. In three runs, the reference spectra (*Type A*), spectra from independent samples (*Type B*), and spectra from the field (*Type C*) are presented successively. Here, no single *false positive* result is permitted.

Finally, a report is generated from the validation run results and is archived together with the parameters of the model generation in audit-compliant manner.

### Number of independent samples (batches) in calibration and validation

A sample is considered independent if no sample from the same batch has been included in the calibration of the chemometric model.

| Substance/substance group | Type A | Type B | Type C |
|---------------------------|--------|--------|--------|
| Macrogol ointment         | 9      | 8      | 86     |

## Second-stage model

For differentiation of the substance/substance group *Macrogol ointment* the following second-stage model is used:

*no second-stage model*

## Calibration samples

Only spectra which have been recorded by *HiperScan GmbH* from traceable samples are used for the generation of the [chemometric models](#). The following samples have been obtained from the substance/substance group *Macrogol ointment*:

| Supplier | Substance         | Batch    | Sample ID | Spectra | Certificate |
|----------|-------------------|----------|-----------|---------|-------------|
| Caelo    | Macrogol ointment | 13002502 | 31004     | 40      | 20130108    |
| Caelo    | Macrogol ointment | 13177801 | 31247     | 40      | 1405327     |
| Caelo    | Macrogol ointment | 14078601 | 31442     | 40      | 20140321    |
| Caelo    | Macrogol ointment | 13177801 | 31486     | 40      | 20130709    |
| Caelo    | Macrogol ointment | 153838   | 31989     | 60      | 20151117*   |
| Caelo    | Macrogol ointment | 162577   | 32493     | 40      | 20160928*   |
| Caelo    | Macrogol ointment | 162578   | 32494     | 40      | 20160928*   |
| Caelo    | Macrogol ointment | 172237   | 33751     | 40      | 20170828*   |

| Caelo    | Macrogol ointment | 190511   | 34532     | 40      | 20190325*   |

## Validation samples

A total of 396 793 spectra were provided for validation. The results were evaluated separately according to the following sample categories:

**Type A** All calibration spectra.

- 420 spectra of 10 reference samples from the substance/substance group *Macrogol ointment*. These samples are listed above in the [calibration samples](#) section. The reference samples come from 9 different batches.
- 63 519 spectra from a total of 1298 batches from further 223 substances. These spectra were recorded by *HiperScan GmbH*. *Type A* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type A* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix A](#). The samples in [Appendix A](#) were added for model generation not with the intention to have the model identify these substances, but with the intention to make the model reject them despite their similarity to substances identifiable.

**Type B** Spectra from independent samples not included in the database structure. Measurement is carried out by *HiperScan GmbH*.

Samples from batches of which no spectra have been included in the database structure are considered as independent samples. The number of batches from which independent samples supplied *Type B* spectra for validation is shown below, representing the number of independent *Type B* samples. Samples, of which some of the spectra have been included in the database structure and other spectra in the validation, are marked with a <sup>†</sup>. The following applies to the remaining unmarked samples: In the same batch, there was at least one additional sample (other sales container, other sample ID) from which reference spectra (*Type A*) were included in the database structure.

\*The spectra were taken from a part of the same sample which the supplier used for its analysis (identity, purity, content). In this case the manufacturer certificates proof the identity and quality of the sample from those the spectra descend.

- 330 spectra of 8 reference samples from the substance/substance group *Macrogol ointment*.
- Among them are spectra of independent samples from 8 batches from which no spectra have been included in the database structure. They are sorted upwards in the following table and separated from the additional samples by a line.

| Supplier | Substance         | Batch    | Sample ID | Spectra |
|----------|-------------------|----------|-----------|---------|
| Caelo    | Macrogol ointment | 182006   | 34257     | 40      |
| Caelo    | Macrogol ointment | 182587   | 34357     | 40      |
| Caelo    | Macrogol ointment | 20001522 | 34965     | 40      |
| Caelo    | Macrogol ointment | 20002367 | 35109     | 40      |
| Caelo    | Macrogol ointment | 21000675 | 35337     | 40      |
| Caelo    | Macrogol ointment | 21000676 | 35338     | 40      |
| Caelo    | Macrogol ointment | 21001140 | 35339     | 40      |
| Caelo    | Macrogol ointment | 21001538 | 35524     | 50      |

- 91 161 spectra from a total of 2008 batches from further 345 substances. These spectra were recorded by *HiperScan GmbH*. *Type B* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type B* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix B](#).

**Type C** Spectra of independent samples not included in the database structure. *Apo-Ident* customers carry out the measurements. *HiperScan GmbH* generally does not verify the information provided by the customer regarding manufacturer and batch number.

- 474 spectra from 200 *Apo-Ident* customers from 90 batches from the substance/substance group *Macrogol ointment*.
- Among them are spectra of independent samples from 86 batches from which no spectra have been included in the database structure. These are sorted upwards in the following table.

| Supplier                   | Substance         | Batch       | Spectra |
|----------------------------|-------------------|-------------|---------|
| Alliance Healthcare        | Macrogol ointment | 19278701    | 1       |

- 240 889 spectra from 1121 *Apo-Ident* customers from a total of 46 919 batches from a further 342 substances. These spectra were recorded by *Apo-Ident* customers. *Type C* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type C* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix C](#).

## Validation results

The validation runs checked whether the substance/substance group *Macrogol ointment* can clearly be distinguished from all other substances using NIR spectroscopy with *Apo-Ident*. For this purpose, all relevant spectra of the various substances were compared with *Macrogol ointment* and it was evaluated how many matches (positive) and rejections (negative) were correct or incorrect. The following table breaks down the numbers of correct and incorrect results according to the expected result (*positive/negative*) and the validation spectrum type (*A/B/C*).

|               | False positive | True positive | False negative | True negative |
|---------------|----------------|---------------|----------------|---------------|
| <b>Type A</b> | 0              | 420           | 0              | 63 519        |
| <b>Type B</b> | 0              | 330           | 0              | 91 081        |
| <b>Type C</b> | 0              | 474           | 0              | 240 889       |

The substance/substance group *Macrogol ointment* can be clearly distinguished from all other substances. In order to make these figures comparable, the weighted *true negative rate* (*specificity*) and the weighted *true positive rate* (*recognition rate*) are determined:

|               | Specificity              | Recognition rate         |
|---------------|--------------------------|--------------------------|
| <b>Type A</b> | 100.0000 % (> 99.9797 %) | 100.0000 % (> 98.5714 %) |
| <b>Type B</b> | 100.0000 % (> 99.9655 %) | 100.0000 % (> 98.1818 %) |
| <b>Type C</b> | 100.0000 % (> 99.6849 %) | 100.0000 % (> 98.7342 %) |

In order to ensure that each substance is entered with the same weight irrespective of the number of spectra available, each spectrum is weighted with the reciprocal value of its number. (If several new spectra of a substance with a very distinctive spectrum are added, the values for *specificity* and *recognition rate* are safer, but are by no means idealised.)

In order to illustrate the impact of the number of spectra, a comparison is made in parentheses as to how the *specificity* or *recognition rate* would worsen if three additional incorrect results were to exist amongst the spectra ([Rule of Three](#) [10, 11]). The larger the number of spectra, the lower the deterioration if the three hypothetical *incorrect results* were added.

Where the number of spectra does not exceed 20, no *recognition rate* is provided.

## Nearest chemometric neighbours

The following table lists the closest chemometric neighbours of the substance/substance group *Macrogol ointment* in the substance class *APIs & excipients, liquid/semi-solid (with analysis certificate)*. Furthermore, their *Mahalanobis distance* is specified within the main model and, where appropriate, within the second-stage model.

| Substance      | Distance in main model | Distance in second-stage model |
|----------------|------------------------|--------------------------------|
| Macrogols 400  | 34.62                  | —                              |
| Macrogols 300  | 47.12                  | —                              |
| Polysorbate 20 | 77.76                  | —                              |

The list stops after the first substance with a *Mahalanobis distance* greater than 50. If the substance/substance group *Macrogol ointment* is separated from critical neighbours in a second-stage model, all the remaining substances in the second-stage model follow.

### Identity according to identity test using NIR spectroscopy

For each substance, a certificate of the correct identity is obtained from an independent GMP-certified test laboratory. If the identity of the sample can be provided using NIR on an independently tested reference sample, in the following table the *Mahalanobis distance* to the reference sample is specified as well as the *Mahalanobis distance* to the next non-identical substance:

| Sample ID | Reference sample ID | Distance to reference sample | Distance to next foreign sample |
|-----------|---------------------|------------------------------|---------------------------------|
| 31004     | 31989               | 4.91                         | 38.19                           |
| 31247     | 31247               | 0.00                         | 38.70                           |
| 31442     | 33751               | 7.48                         | 27.95                           |
| 31486     | 33751               | 5.45                         | 33.52                           |
| 31989     | 31989               | 0.00                         | 38.01                           |
| 32493     | 32493               | 0.00                         | 34.23                           |
| 32494     | 32494               | 0.00                         | 40.45                           |
| 33751     | 33751               | 0.00                         | 34.37                           |
| 34531     | 34531               | 0.00                         | 41.73                           |
| 34532     | 34532               | 0.00                         | 34.19                           |

The identity of a sample will be confirmed by NIR if the distance to the next foreign sample is at least 50 % greater than the distance to a reference sample whose identity has been established by laboratory testing. This criterion is always considered in the chemometric model, which contains all substances of the substance class, even if a second-stage dissolves a subgroup of similar substances, thereby increasing the distances between them. The samples confirmed by NIR support the statistical variance of the original reference substance, but cannot add new aspects or forms of the substance.

# VALIDATION REPORT

## IdentModule 2.4-2021-04

Validated substance/substance group **Macrogol-2-laurylether**  
Substance class APIs & excipients, liquid/semi-solid (with analysis certificate)  
Report date 08/11/2021  
Report number 31731-2021-11-08  
Executing company HiperScan GmbH  
Weißeritzstraße 3  
01067 Dresden  
Germany

### Relevant substance names

Macrogol-2-laurylether; Dehydol® LS 2

### Special notes

When selecting the *Macrogol-2-laurylether* substance/substance group, the following information is displayed to the user:

- Advice: Currently no longer available from major pharmaceutical manufacturers. Therefore, batch maintenance is currently not possible.

### Applicable documents

978-3-7692-7517-9 *European Pharmacopoeia 10th Edition, Basic Version 2020* [3]  
Komm2.2.40 *Erfüllung von Ph. Eur. 2.2.40 durch Apo-Ident* [4]  
AA004 *Erstellung und Validierung eines IdentModul-Updates*

### Validation method

Validation is performed after every change to the chemometric model (also “database”) in three steps:

1. The chemometric model is calculated from the calibration spectra using a *PCA algorithm*. The calibration spectra originate from the calibration samples of all substances in this class.
2. In the *chemometric model* generated, the distances between all separable substances are checked for compliance with the specified safety distances.
3. All spectra are presented to the generated chemometric model for evaluation. In three runs, the reference spectra (*Type A*), spectra from independent samples (*Type B*), and spectra from the field (*Type C*) are presented successively. Here, no single *false positive* result is permitted.

Finally, a report is generated from the validation run results and is archived together with the parameters of the model generation in audit-compliant manner.

### Number of independent samples (batches) in calibration and validation

A sample is considered independent if no sample from the same batch has been included in the calibration of the chemometric model.

| Substance/substance group | Type A | Type B | Type C |
|---------------------------|--------|--------|--------|
| Macrogol-2-laurylether    | 2      | 1      | 9      |

## Second-stage model

For differentiation of the substance/substance group *Macrogol-2-laurylether* the following second-stage model is used:

*no second-stage model*

## Calibration samples

Only spectra which have been recorded by *HiperScan GmbH* from traceable samples are used for the generation of the [chemometric models](#). The following samples have been obtained from the substance/substance group *Macrogol-2-laurylether*:

| Supplier | Substance           | Batch    | Sample ID | Spectra | Certificate |
|----------|---------------------|----------|-----------|---------|-------------|
| Caelo    | Macrogol-2-laury... | 14054304 | 31731     | 60      | 1603434     |
| Caelo    | Macrogol-2-laury... | 14054309 | 31867     | 60      | 20140225    |

## Validation samples

A total of 396 793 spectra were provided for validation. The results were evaluated separately according to the following sample categories:

**Type A** All calibration spectra.

- 120 spectra of 2 reference samples from the substance/substance group *Macrogol-2-laurylether*. These samples are listed above in the [calibration samples](#) section. The reference samples come from 2 different batches.
- 63 819 spectra from a total of 1305 batches from further 223 substances. These spectra were recorded by *HiperScan GmbH*. *Type A* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type A* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix A](#). The samples in [Appendix A](#) were added for model generation not with the intention to have the model identify these substances, but with the intention to make the model reject them despite their similarity to substances identifiable.

**Type B** Spectra from independent samples not included in the database structure. Measurement is carried out by *HiperScan GmbH*.

Samples from batches of which no spectra have been included in the database structure are considered as independent samples. The number of batches from which independent samples supplied *Type B* spectra for validation is shown below, representing the number of independent *Type B* samples. Samples, of which some of the spectra have been included in the database structure and other spectra in the validation, are marked with a <sup>†</sup>. The following applies to the remaining unmarked samples: In the same batch, there was at least one additional sample (other sales container, other sample ID) from which reference spectra (*Type A*) were included in the database structure.

- 40 spectra of 1 reference samples from the substance/substance group *Macrogol-2-laurylether*.
- Among them are spectra of independent samples from 1 batches from which no spectra have been included in the database structure. They are sorted upwards in the following table and separated from the additional samples by a line.

| Supplier | Substance              | Batch    | Sample ID | Spectra |
|----------|------------------------|----------|-----------|---------|
| Caelo    | Macrogol-2-laurylether | 15411908 | 33273     | 40      |

- 91 451 spectra from a total of 2015 batches from further 345 substances. These spectra were recorded by *HiperScan GmbH*. *Type B* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type B* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix B](#).

**Type C** Spectra of independent samples not included in the database structure. *Apo-Ident* customers carry out the measurements. *HiperScan GmbH* generally does not verify the information provided by the customer regarding manufacturer and batch number.

- 52 spectra from 22 *Apo-Ident* customers from 9 batches from the substance/substance group *Macrogol-2-laurylether*.
- Among them are spectra of independent samples from 9 batches from which no spectra have been included in the database structure. These are sorted upwards in the following table.

| Supplier             | Substance              | Batch    | Spectra |
|----------------------|------------------------|----------|---------|
| Caelo                | Macrogol-2-laurylether | 15411902 | 4       |
| Caelo                | Macrogol-2-laurylether | 15411904 | 29      |
| Caelo                | Macrogol-2-laurylether | 15411910 | 3       |
| Caelo                | Macrogol-2-laurylether | 18093302 | 5       |
| Caelo                | Macrogol-2-laurylether | 18093301 | 2       |
| Caelo                | Macrogol-2-laurylether | 15411903 | 1       |
| Caelo                | Macrogol-2-laurylether | 18093304 | 2       |
| Caelo                | Macrogol-2-laurylether | 18093303 | 3       |
| Caesar & Loretz GmbH | Macrogol-2-laurylether | 18093302 | 1       |
| Phoenix              | Macrogol-2-laurylether | 18093303 | 1       |
| Sanacorp             | Macrogol-2-laurylether | 15411908 | 1       |

- 241 311 spectra from 1121 *Apo-Ident* customers from a total of 46 997 batches from a further 342 substances. These spectra were recorded by *Apo-Ident* customers. *Type C* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type C* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix C](#).

## Validation results

The validation runs checked whether the substance/substance group *Macrogol-2-laurylether* can clearly be distinguished from all other substances using NIR spectroscopy with *Apo-Ident*. For this purpose, all relevant spectra of the various substances were compared with *Macrogol-2-laurylether* and it was evaluated how many matches (positive) and rejections (negative) were correct or incorrect. The following table breaks down the numbers of correct and incorrect results according to the expected result (*positive/negative*) and the validation spectrum type (*A/B/C*).

|               | False positive | True positive | False negative | True negative |
|---------------|----------------|---------------|----------------|---------------|
| <b>Type A</b> | 0              | 120           | 0              | 63 819        |
| <b>Type B</b> | 0              | 40            | 0              | 91 451        |
| <b>Type C</b> | 0              | 52            | 0              | 241 311       |

The substance/substance group *Macrogol-2-laurylether* can be clearly distinguished from all other substances. In order to make these figures comparable, the weighted *true negative rate* (*specificity*) and the weighted *true positive rate* (*recognition rate*) are determined:

|               | Specificity              | Recognition rate         |
|---------------|--------------------------|--------------------------|
| <b>Type A</b> | 100.0000 % (> 99.9799 %) | 100.0000 % (> 95.0000 %) |
| <b>Type B</b> | 100.0000 % (> 99.9658 %) | 100.0000 % (> 85.0000 %) |
| <b>Type C</b> | 100.0000 % (> 99.6850 %) | 100.0000 % (> 88.4615 %) |

In order to ensure that each substance is entered with the same weight irrespective of the number of spectra available, each spectrum is weighted with the reciprocal value of its number. (If several new spectra of a substance with a very distinctive spectrum are added, the values for *specificity* and *recognition rate* are safer, but are by no means idealised.)

In order to illustrate the impact of the number of spectra, a comparison is made in parentheses as to how the *specificity* or *recognition rate* would worsen if three additional incorrect results were to exist amongst the spectra (*Rule of Three* [10, 11]). The larger the number of spectra, the lower the deterioration if the three hypothetical *incorrect results* were added.

Where the number of spectra does not exceed 20, no *recognition rate* is provided.

### Nearest chemometric neighbours

The following table lists the closest chemometric neighbours of the substance/substance group *Macrogol-2-laurylether* in the substance class *APIs & excipients, liquid/semi-solid (with analysis certificate)*. Furthermore, their *Mahalanobis distance* is specified within the main model and, where appropriate, within the second-stage model.

| Substance                                 | Distance in main model | Distance in second-stage model |
|-------------------------------------------|------------------------|--------------------------------|
| Macrogol 4 lauryl ether                   | 17.05                  | —                              |
| Polysorbate 60                            | 21.31                  | —                              |
| Macrogol 20 glycerol monostearate type... | 24.35                  | —                              |
| Macrogol 8 stearate type I                | 24.92                  | —                              |
| Polyol fatty acid ester                   | 27.08                  | —                              |
| Polysorbate 80                            | 30.70                  | —                              |
| Polysorbate 20                            | 30.99                  | —                              |
| Lauromacrogol 400                         | 31.84                  | —                              |
| Macrogolglycerol hydroxystearate 40       | 36.03                  | —                              |
| Macrogolglycerol ricinoleate              | 37.33                  | —                              |
| Macrogol ointment                         | 37.71                  | —                              |
| Macrogols 400                             | 42.68                  | —                              |
| Triglycerol diisostearate                 | 55.99                  | —                              |

The list stops after the first substance with a *Mahalanobis distance* greater than 50. If the substance/substance group *Macrogol-2-laurylether* is separated from critical neighbours in a second-stage model, all the remaining substances in the second-stage model follow.

### Identity according to identity test using NIR spectroscopy

For each substance, a certificate of the correct identity is obtained from an independent GMP-certified test laboratory. If the identity of the sample can be provided using NIR on an independently tested reference sample, in the following table the *Mahalanobis distance* to the reference sample is specified as well as the *Mahalanobis distance* to the next non-identical substance:

| Sample ID | Reference sample ID | Distance to reference sample | Distance to next foreign sample |
|-----------|---------------------|------------------------------|---------------------------------|
| 31731     | 31731               | 0.00                         | 21.26                           |
| 31867     | 31731               | 5.06                         | 17.05                           |

The identity of a sample will be confirmed by NIR if the distance to the next foreign sample is at least 50 % greater than the distance to a reference sample whose identity has been established by laboratory testing. This criterion is always considered in the chemometric model, which contains all substances of the substance class, even if a second-stage dissolves a subgroup of similar substances, thereby increasing the distances between them. The samples confirmed by NIR support the statistical

variance of the original reference substance, but cannot add new aspects or forms of the substance.

# VALIDATION REPORT

## IdentModule 2.4-2021-04

Validated substance/substance group **Macrogolglycerol ricinoleate**  
Substance class APIs & excipients, liquid/semi-solid (with analysis certificate)  
Report date 08/11/2021  
Report number 10004582-2021-11-08  
Executing company HiperScan GmbH  
Weißeritzstraße 3  
01067 Dresden  
Germany

### Relevant substance names

Macrogolglycerol ricinoleate; Macrogolglyceroli ricinoleas

### Special notes

When selecting the *Macrogolglycerol ricinoleate* substance/substance group, the following information is displayed to the user:

*no information*

### Applicable documents

978-3-7692-7517-9 *European Pharmacopoeia 10th Edition, Basic Version 2020* [3]  
Komm2.2.40 *Erfüllung von Ph. Eur. 2.2.40 durch Apo-Ident* [4]  
AA004 *Erstellung und Validierung eines IdentModul-Updates*

### Validation method

Validation is performed after every change to the chemometric model (also “database”) in three steps:

1. The chemometric model is calculated from the calibration spectra using a *PCA algorithm*. The calibration spectra originate from the calibration samples of all substances in this class.
2. In the *chemometric model* generated, the distances between all separable substances are checked for compliance with the specified safety distances.
3. All spectra are presented to the generated chemometric model for evaluation. In three runs, the reference spectra (*Type A*), spectra from independent samples (*Type B*), and spectra from the field (*Type C*) are presented successively. Here, no single *false positive* result is permitted.

Finally, a report is generated from the validation run results and is archived together with the parameters of the model generation in audit-compliant manner.

### Number of independent samples (batches) in calibration and validation

A sample is considered independent if no sample from the same batch has been included in the calibration of the chemometric model.

| Substance/substance group    | Type A | Type B | Type C |
|------------------------------|--------|--------|--------|
| Macrogolglycerol ricinoleate | 4      | 3      | 58     |

## Second-stage model

For differentiation of the substance/substance group *Macrogolglycerol ricinoleate* the following second-stage model is used:

- [Submodel 10](#)

## Calibration samples

Only spectra which have been recorded by *HiperScan GmbH* from traceable samples are used for the generation of the [chemometric models](#). The following samples have been obtained from the substance/substance group *Macrogolglycerol ricinoleate*:

| Supplier | Substance           | Batch     | Sample ID | Spectra | Certificate |
|----------|---------------------|-----------|-----------|---------|-------------|
| Caelo    | Macrogolglycerol... | 13272708  | 31368     | 39      | 1505503     |
| Caelo    | Macrogolglycerol... | 161303    | 32297     | 40      | 20160523*   |
| Fagron   | Macrogolglycerol... | 12E29-N02 | 30766     | 60      | 20120612    |
| Fagron   | Macrogolglycerol... | 12H08-N01 | 31015     | 40      | 20120827    |

## Validation samples

A total of 396 793 spectra were provided for validation. The results were evaluated separately according to the following sample categories:

**Type A** All calibration spectra.

- 179 spectra of 4 reference samples from the substance/substance group *Macrogolglycerol ricinoleate*. These samples are listed above in the [calibration samples](#) section. The reference samples come from 4 different batches.
- 63 760 spectra from a total of 1303 batches from further 223 substances. These spectra were recorded by *HiperScan GmbH*. *Type A* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type A* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix A](#). The samples in [Appendix A](#) were added for model generation not with the intention to have the model identify these substances, but with the intention to make the model reject them despite their similarity to substances identifiable.

**Type B** Spectra from independent samples not included in the database structure. Measurement is carried out by *HiperScan GmbH*.

Samples from batches of which no spectra have been included in the database structure are considered as independent samples. The number of batches from which independent samples supplied *Type B* spectra for validation is shown below, representing the number of independent *Type B* samples. Samples, of which some of the spectra have been included in the database structure and other spectra in the validation, are marked with a <sup>†</sup>. The following applies to the remaining unmarked samples: In the same batch, there was at least one additional sample (other sales container, other sample ID) from which reference spectra (*Type A*) were included in the database structure.

- 120 spectra of 3 reference samples from the substance/substance group *Macrogolglycerol ricinoleate*.
- Among them are spectra of independent samples from 3 batches from which no spectra have been included in the database structure. They are sorted upwards in the following table and separated from the additional samples by a line.

\*The spectra were taken from a part of the same sample which the supplier used for its analysis (identity, purity, content). In this case the manufacturer certificates proof the identity and quality of the sample from those the spectra descend.

| Supplier | Substance                    | Batch            | Sample ID | Spectra |
|----------|------------------------------|------------------|-----------|---------|
| Caelo    | Macrogolglycerol ricinoleate | 161545           | 32338     | 40      |
| Caelo    | Macrogolglycerol ricinoleate | 172238           | 33707     | 40      |
| Fagron   | Macrogolglycerol ricinoleate | 20I29-T01-083604 | 35463     | 40      |

- 91 371 spectra from a total of 2013 batches from further 345 substances. These spectra were recorded by *HiperScan GmbH*. *Type B* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type B* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix B](#).

**Type C** Spectra of independent samples not included in the database structure. *Apo-Ident* customers carry out the measurements. *HiperScan GmbH* generally does not verify the information provided by the customer regarding manufacturer and batch number.

- 113 spectra from 71 *Apo-Ident* customers from 58 batches from the substance/substance group *Macrogolglycerol ricinoleate*.
- Among them are spectra of independent samples from 58 batches from which no spectra have been included in the database structure. These are sorted upwards in the following table.

| Supplier                   | Substance                    | Batch            | Spectra |
|----------------------------|------------------------------|------------------|---------|

- 241 250 spectra from 1121 *Apo-Ident* customers from a total of 46 949 batches from a further 342 substances. These spectra were recorded by *Apo-Ident* customers. *Type C* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type C* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix C](#).

## Validation results

The validation runs checked whether the substance/substance group *Macrogolglycerol ricinoleate* can clearly be distinguished from all other substances using NIR spectroscopy with *Apo-Ident*. For this purpose, all relevant spectra of the various substances were compared with *Macrogolglycerol ricinoleate* and it was evaluated how many matches (positive) and rejections (negative) were correct or incorrect. The following table breaks down the numbers of correct and incorrect results according to the expected result (*positive/negative*) and the validation spectrum type (*A/B/C*).

|        | False positive | True positive | False negative | True negative |
|--------|----------------|---------------|----------------|---------------|
| Type A | 0              | 179           | 0              | 63 760        |
| Type B | 0              | 120           | 0              | 91 371        |
| Type C | 0              | 113           | 0              | 241 250       |

The substance/substance group *Macrogolglycerol ricinoleate* can be clearly distinguished from all other substances. In order to make these figures comparable, the weighted *true negative rate* (*specificity*) and the weighted *true positive rate* (*recognition rate*) are determined:

|        | Specificity              | Recognition rate         |
|--------|--------------------------|--------------------------|
| Type A | 100.0000 % (> 99.9798 %) | 100.0000 % (> 96.6480 %) |
| Type B | 100.0000 % (> 99.9656 %) | 100.0000 % (> 95.0000 %) |
| Type C | 100.0000 % (> 99.6849 %) | 100.0000 % (> 94.6903 %) |

In order to ensure that each substance is entered with the same weight irrespective of the number of spectra available, each spectrum is weighted with the reciprocal value of its number. (If several new spectra of a substance with a very distinctive spectrum are added, the values for *specificity* and *recognition rate* are safer, but are by no means idealised.)

In order to illustrate the impact of the number of spectra, a comparison is made in parentheses as to how the *specificity* or *recognition rate* would worsen if three additional incorrect results were to exist amongst the spectra (*Rule of Three* [10, 11]). The larger the number of spectra, the lower the deterioration if the three hypothetical *incorrect results* were added.

Where the number of spectra does not exceed 20, no *recognition rate* is provided.

### Nearest chemometric neighbours

The following table lists the closest chemometric neighbours of the substance/substance group *Macrogolglycerol ricinoleate* in the substance class *APIs & excipients, liquid/semi-solid (with analysis certificate)*. Furthermore, their *Mahalanobis distance* is specified within the main model and, where appropriate, within the second-stage model.

| Substance                                 | Distance in main model | Distance in second-stage model |
|-------------------------------------------|------------------------|--------------------------------|
| Polysorbate 80                            | 12.11                  | 14.63                          |
| Polyol fatty acid ester                   | 18.07                  | —                              |
| Polysorbate 60                            | 28.45                  | 29.42                          |
| Macrogol 8 stearate type I                | 28.78                  | 39.69                          |
| Polysorbate 20                            | 29.17                  | 34.88                          |
| Macrogol 20 glycerol monostearate type... | 30.81                  | 23.38                          |
| Macrogolglycerol hydroxystearate 40       | 32.81                  | 18.68                          |
| Lauromacrogol 400                         | 40.36                  | 33.23                          |
| Macrogol ointment                         | 40.74                  | —                              |
| Pasta Cordes®                             | 61.99                  | —                              |
| ⋮                                         | ⋮                      | ⋮                              |
| Macrogol 4 lauryl ether                   | >50                    | 76.19                          |

The list stops after the first substance with a *Mahalanobis distance* greater than 50. If the substance/substance group *Macrogolglycerol ricinoleate* is separated from critical neighbours in a second-stage model, all the remaining substances in the second-stage model follow.

### Identity according to identity test using NIR spectroscopy

For each substance, a certificate of the correct identity is obtained from an independent GMP-certified test laboratory. If the identity of the sample can be provided using NIR on an independently tested reference sample, in the following table the *Mahalanobis distance* to the reference sample is specified as well as the *Mahalanobis distance* to the next non-identical substance:

| Sample ID | Reference sample ID | Distance to reference sample | Distance to next foreign sample |
|-----------|---------------------|------------------------------|---------------------------------|
| 30766     | 32297               | 2.42                         | 12.47                           |
| 31015     | 32297               | 4.97                         | 14.29                           |
| 31368     | 31368               | 0.00                         | 11.37                           |
| 32297     | 32297               | 0.00                         | 12.52                           |

The identity of a sample will be confirmed by NIR if the distance to the next foreign sample is at least 50 % greater than the distance to a reference sample whose identity has been established by laboratory testing. This criterion is always considered in the chemometric model, which contains all substances of the substance class, even if a second-stage dissolves a subgroup of similar substances, thereby increasing the distances between them. The samples confirmed by NIR support the statistical variance of the original reference substance, but cannot add new aspects or forms of the substance.

# VALIDATION REPORT

## IdentModule 2.4-2021-04

Validated substance/substance group **Macrogols 300**  
Substance class APIs & excipients, liquid/semi-solid (with analysis certificate)  
Report date 08/11/2021  
Report number 31151-2021-11-08  
Executing company HiperScan GmbH  
Weißeritzstraße 3  
01067 Dresden  
Germany

### Relevant substance names

Macrogols 300; Polyethylenglycol 300

### Special notes

When selecting the *Macrogols 300* substance/substance group, the following information is displayed to the user:

*no information*

### Applicable documents

978-3-7692-7517-9 *European Pharmacopoeia 10th Edition, Basic Version 2020* [3]  
Komm2.2.40 *Erfüllung von Ph. Eur. 2.2.40 durch Apo-Ident* [4]  
AA004 *Erstellung und Validierung eines IdentModul-Updates*

### Validation method

Validation is performed after every change to the chemometric model (also “database”) in three steps:

1. The chemometric model is calculated from the calibration spectra using a *PCA algorithm*. The calibration spectra originate from the calibration samples of all substances in this class.
2. In the *chemometric model* generated, the distances between all separable substances are checked for compliance with the specified safety distances.
3. All spectra are presented to the generated chemometric model for evaluation. In three runs, the reference spectra (*Type A*), spectra from independent samples (*Type B*), and spectra from the field (*Type C*) are presented successively. Here, no single *false positive* result is permitted.

Finally, a report is generated from the validation run results and is archived together with the parameters of the model generation in audit-compliant manner.

### Number of independent samples (batches) in calibration and validation

A sample is considered independent if no sample from the same batch has been included in the calibration of the chemometric model.

| Substance/substance group | Type A | Type B | Type C |
|---------------------------|--------|--------|--------|
| Macrogols 300             | 8      | 3      | 44     |

## Second-stage model

For differentiation of the substance/substance group *Macrogols 300* the following second-stage model is used:

*no second-stage model*

## Calibration samples

Only spectra which have been recorded by *HiperScan GmbH* from traceable samples are used for the generation of the [chemometric models](#). The following samples have been obtained from the substance/substance group *Macrogols 300*:

| Supplier | Substance     | Batch    | Sample ID | Spectra | Certificate |
|----------|---------------|----------|-----------|---------|-------------|
| Caelo    | Macrogols 300 | 13070109 | 31151     | 40      | 1403339     |
| Caelo    | Macrogols 300 | 14043802 | 31370     | 40      | 20140221    |
| Caelo    | Macrogols 300 | 16022102 | 32073     | 60      | 20160222    |
| Caelo    | Macrogols 300 | 160221   | 32209     | 40      | 20160222*   |
| Caelo    | Macrogols 300 | 161609   | 32212     | 40      | 20160607*   |
| Caelo    | Macrogols 300 | 162196   | 32337     | 40      | 20160729*   |
| Caelo    | Macrogols 300 | 182525   | 34312     | 40      | 20181011*   |
| Caelo    | Macrogols 300 | 183201   | 34325     | 40      | 20181214*   |

## Validation samples

A total of 396 793 spectra were provided for validation. The results were evaluated separately according to the following sample categories:

**Type A** All calibration spectra.

- 340 spectra of 8 reference samples from the substance/substance group *Macrogols 300*. These samples are listed above in the [calibration samples](#) section. The reference samples come from 8 different batches.
- 63 599 spectra from a total of 1299 batches from further 223 substances. These spectra were recorded by *HiperScan GmbH*. *Type A* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type A* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix A](#). The samples in [Appendix A](#) were added for model generation not with the intention to have the model identify these substances, but with the intention to make the model reject them despite their similarity to substances identifiable.

**Type B** Spectra from independent samples not included in the database structure. Measurement is carried out by *HiperScan GmbH*.

Samples from batches of which no spectra have been included in the database structure are considered as independent samples. The number of batches from which independent samples supplied *Type B* spectra for validation is shown below, representing the number of independent *Type B* samples. Samples, of which some of the spectra have been included in the database structure and other spectra in the validation, are marked with a <sup>†</sup>. The following applies to the remaining unmarked samples: In the same batch, there was at least one additional sample (other sales container, other sample ID) from which reference spectra (*Type A*) were included in the database structure.

- 120 spectra of 3 reference samples from the substance/substance group *Macrogols 300*.

\*The spectra were taken from a part of the same sample which the supplier used for its analysis (identity, purity, content). In this case the manufacturer certificates proof the identity and quality of the sample from those the spectra descend.

- Among them are spectra of independent samples from 3 batches from which no spectra have been included in the database structure. They are sorted upwards in the following table and separated from the additional samples by a line.

| Supplier | Substance     | Batch       | Sample ID | Spectra |
|----------|---------------|-------------|-----------|---------|
| Caelo    | Macrogols 300 | 172105      | 33710     | 40      |
| Caelo    | Macrogols 300 | 181748      | 34232     | 40      |
| Caelo    | Macrogols 300 | 20002036004 | 35133     | 40      |

- 91 371 spectra from a total of 2013 batches from further 345 substances. These spectra were recorded by *HiperScan GmbH*. *Type B* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type B* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix B](#).

**Type C** Spectra of independent samples not included in the database structure. *Apo-Ident* customers carry out the measurements. *HiperScan GmbH* generally does not verify the information provided by the customer regarding manufacturer and batch number.

- 122 spectra from 73 *Apo-Ident* customers from 47 batches from the substance/substance group *Macrogols 300*.
- Among them are spectra of independent samples from 44 batches from which no spectra have been included in the database structure. These are sorted upwards in the following table.

| Supplier        | Substance     | Batch       | Spectra |
|-----------------|---------------|-------------|---------|

- 241 241 spectra from 1121 *Apo-Ident* customers from a total of 46 959 batches from a further 342 substances. These spectra were recorded by *Apo-Ident* customers. *Type C* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type C* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix C](#).

## Validation results

The validation runs checked whether the substance/substance group *Macrogols 300* can clearly be distinguished from all other substances using NIR spectroscopy with *Apo-Ident*. For this purpose, all relevant spectra of the various substances were compared with *Macrogols 300* and it was evaluated how many matches (positive) and rejections (negative) were correct or incorrect. The following table breaks down the numbers of correct and incorrect results according to the expected result (*positive/negative*) and the validation spectrum type (*A/B/C*).

|               | False positive | True positive | False negative | True negative |
|---------------|----------------|---------------|----------------|---------------|
| <b>Type A</b> | 0              | 340           | 0              | 63 599        |
| <b>Type B</b> | 0              | 120           | 0              | 91 371        |
| <b>Type C</b> | 0              | 121           | 1              | 241 241       |

The substance/substance group *Macrogols 300* can be clearly distinguished from all other substances. In order to make these figures comparable, the weighted *true negative rate* (*specificity*) and the weighted *true positive rate* (*recognition rate*) are determined:

|               | Specificity              | Recognition rate         |
|---------------|--------------------------|--------------------------|
| <b>Type A</b> | 100.0000 % (> 99.9797 %) | 100.0000 % (> 98.2353 %) |
| <b>Type B</b> | 100.0000 % (> 99.9656 %) | 100.0000 % (> 95.0000 %) |
| <b>Type C</b> | 100.0000 % (> 99.6849 %) | 99.1803 % (> 96.7213 %)  |

In order to ensure that each substance is entered with the same weight irrespective of the number of spectra available, each spectrum is weighted with the reciprocal value of its number. (If several new spectra of a substance with a very distinctive spectrum are added, the values for *specificity* and *recognition rate* are safer, but are by no means idealised.)

In order to illustrate the impact of the number of spectra, a comparison is made in parentheses as to how the *specificity* or *recognition rate* would worsen if three additional incorrect results were to exist amongst the spectra (*Rule of Three* [10, 11]). The larger the number of spectra, the lower the deterioration if the three hypothetical *incorrect results* were added.

Where the number of spectra does not exceed 20, no *recognition rate* is provided.

### Nearest chemometric neighbours

The following table lists the closest chemometric neighbours of the substance/substance group *Macrogols 300* in the substance class *APIs & excipients, liquid/semi-solid (with analysis certificate)*. Furthermore, their *Mahalanobis distance* is specified within the main model and, where appropriate, within the second-stage model.

| Substance         | Distance in<br>main model | Distance in<br>second-stage model |
|-------------------|---------------------------|-----------------------------------|
| Macrogols 400     | 26.69                     | —                                 |
| Macrogol ointment | 34.54                     | —                                 |
| Lanolin DAB       | 84.73                     | —                                 |

The list stops after the first substance with a *Mahalanobis distance* greater than 50. If the substance/substance group *Macrogols 300* is separated from critical neighbours in a second-stage model, all the remaining substances in the second-stage model follow.

### Identity according to identity test using NIR spectroscopy

For each substance, a certificate of the correct identity is obtained from an independent GMP-certified test laboratory. If the identity of the sample can be provided using NIR on an independently tested reference sample, in the following table the *Mahalanobis distance* to the reference sample is specified as well as the *Mahalanobis distance* to the next non-identical substance:

| Sample ID | Reference<br>sample ID | Distance to<br>reference sample | Distance to<br>next foreign sample |
|-----------|------------------------|---------------------------------|------------------------------------|
| 31151     | 31151                  | 0.00                            | 49.35                              |
| 31370     | 31151                  | 4.11                            | 46.02                              |
| 32073     | 32209                  | 0.48                            | 40.65                              |
| 32209     | 32209                  | 0.00                            | 40.35                              |
| 32212     | 32212                  | 0.00                            | 40.08                              |
| 32337     | 32337                  | 0.00                            | 41.41                              |
| 34312     | 34312                  | 0.00                            | 38.28                              |
| 34325     | 34325                  | 0.00                            | 38.51                              |

The identity of a sample will be confirmed by NIR if the distance to the next foreign sample is at least 50 % greater than the distance to a reference sample whose identity has been established by laboratory testing. This criterion is always considered in the chemometric model, which contains all substances of the substance class, even if a second-stage dissolves a subgroup of similar substances, thereby increasing the distances between them. The samples confirmed by NIR support the statistical variance of the original reference substance, but cannot add new aspects or forms of the substance.

# VALIDATION REPORT

## IdentModule 2.4-2021-04

Validated substance/substance group **Macrogols 400**  
Substance class APIs & excipients, liquid/semi-solid (with analysis certificate)  
Report date 08/11/2021  
Report number 30523-2021-11-08  
Executing company HiperScan GmbH  
Weißeritzstraße 3  
01067 Dresden  
Germany

### Relevant substance names

Macrogols 400; Macrogolum 400

### Special notes

When selecting the *Macrogols 400* substance/substance group, the following information is displayed to the user:

*no information*

### Applicable documents

978-3-7692-7517-9 *European Pharmacopoeia 10th Edition, Basic Version 2020* [3]  
Komm2.2.40 *Erfüllung von Ph. Eur. 2.2.40 durch Apo-Ident* [4]  
AA004 *Erstellung und Validierung eines IdentModul-Updates*

### Validation method

Validation is performed after every change to the chemometric model (also “database”) in three steps:

1. The chemometric model is calculated from the calibration spectra using a *PCA algorithm*. The calibration spectra originate from the calibration samples of all substances in this class.
2. In the *chemometric model* generated, the distances between all separable substances are checked for compliance with the specified safety distances.
3. All spectra are presented to the generated chemometric model for evaluation. In three runs, the reference spectra (*Type A*), spectra from independent samples (*Type B*), and spectra from the field (*Type C*) are presented successively. Here, no single *false positive* result is permitted.

Finally, a report is generated from the validation run results and is archived together with the parameters of the model generation in audit-compliant manner.

### Number of independent samples (batches) in calibration and validation

A sample is considered independent if no sample from the same batch has been included in the calibration of the chemometric model.

| Substance/substance group | Type A | Type B | Type C |
|---------------------------|--------|--------|--------|
| Macrogols 400             | 6      | 17     | 241    |

## Second-stage model

For differentiation of the substance/substance group *Macrogols 400* the following second-stage model is used:

*no second-stage model*

## Calibration samples

Only spectra which have been recorded by *HiperScan GmbH* from traceable samples are used for the generation of the [chemometric models](#). The following samples have been obtained from the substance/substance group *Macrogols 400*:

| Supplier | Substance     | Batch    | Sample ID | Spectra | Certificate |
|----------|---------------|----------|-----------|---------|-------------|
| Caelo    | Macrogols 400 | 13171112 | 31149     | 40      | 1403644     |
| Caelo    | Macrogols 400 | 14009101 | 31367     | 40      | 20140123    |

| Euro OTC | Macrogols 400 | 1510042  | 31814     | 60      | 20151216*   |
| Euro OTC | Macrogols 400 | 1609017  | 32714     | 40      | 20160929*   |
| Euro OTC | Macrogols 400 | 1911028  | 34812     | 40      | 20200128*   |

## Validation samples

A total of 396 793 spectra were provided for validation. The results were evaluated separately according to the following sample categories:

**Type A** All calibration spectra.

- 260 spectra of 6 reference samples from the substance/substance group *Macrogols 400*. These samples are listed above in the [calibration samples](#) section. The reference samples come from 6 different batches.
- 63 679 spectra from a total of 1301 batches from further 223 substances. These spectra were recorded by *HiperScan GmbH*. *Type A* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type A* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix A](#). The samples in [Appendix A](#) were added for model generation not with the intention to have the model identify these substances, but with the intention to make the model reject them despite their similarity to substances identifiable.

**Type B** Spectra from independent samples not included in the database structure. Measurement is carried out by *HiperScan GmbH*.

Samples from batches of which no spectra have been included in the database structure are considered as independent samples. The number of batches from which independent samples supplied *Type B* spectra for validation is shown below, representing the number of independent *Type B* samples. Samples, of which some of the spectra have been included in the database structure and other spectra in the validation, are marked with a <sup>†</sup>. The following applies to the remaining unmarked samples: In the same batch, there was at least one additional sample (other sales container, other sample ID) from which reference spectra (*Type A*) were included in the database structure.

- 700 spectra of 17 reference samples from the substance/substance group *Macrogols 400*.

\*The spectra were taken from a part of the same sample which the supplier used for its analysis (identity, purity, content). In this case the manufacturer certificates proof the identity and quality of the sample from those the spectra descend.

- Among them are spectra of independent samples from 17 batches from which no spectra have been included in the database structure. They are sorted upwards in the following table and separated from the additional samples by a line.

| Supplier | Substance     | Batch    | Sample ID | Spectra |
|----------|---------------|----------|-----------|---------|
| Caelo    | Macrogols 400 | 160022   | 32211     | 40      |

| Euro OTC | Macrogols 400 | 1807027  | 34214     | 40      |
| Euro OTC | Macrogols 400 | 1906024  | 34655     | 40      |
| Euro OTC | Macrogols 400 | 2009008  | 35126     | 40      |
| Euro OTC | Macrogols 400 | 2105008  | 35581     | 50      |

- 90 791 spectra from a total of 1999 batches from further 345 substances. These spectra were recorded by *HiperScan GmbH*. *Type B* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type B* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix B](#).

**Type C** Spectra of independent samples not included in the database structure. *Apo-Ident* customers carry out the measurements. *HiperScan GmbH* generally does not verify the information provided by the customer regarding manufacturer and batch number.

- 1553 spectra from 474 *Apo-Ident* customers from 245 batches from the substance/substance group *Macrogols 400*.
- Among them are spectra of independent samples from 241 batches from which no spectra have been included in the database structure. These are sorted upwards in the following table.

| Supplier                   | Substance     | Batch            | Spectra |

- 239 810 spectra from 1121 *Apo-Ident* customers from a total of 46 764 batches from a further 342 substances. These spectra were recorded by *Apo-Ident* customers. *Type C* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type C* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix C](#).

## Validation results

The validation runs checked whether the substance/substance group *Macrogols 400* can clearly be distinguished from all other substances using NIR spectroscopy with *Apo-Ident*. For this purpose, all relevant spectra of the various substances were compared with *Macrogols 400* and it was evaluated how many matches (positive) and rejections (negative) were correct or incorrect. The following table breaks down the numbers of correct and incorrect results according to the expected result (*positive/negative*) and the validation spectrum type (*A/B/C*).

|               | False positive | True positive | False negative | True negative |
|---------------|----------------|---------------|----------------|---------------|
| <b>Type A</b> | 0              | 260           | 0              | 63 679        |
| <b>Type B</b> | 0              | 700           | 0              | 90 791        |
| <b>Type C</b> | 0              | 1542          | 11             | 239 810       |

The substance/substance group *Macrogols 400* can be clearly distinguished from all other substances. In order to make these figures comparable, the weighted *true negative rate (specificity)* and the weighted *true positive rate (recognition rate)* are determined:

|               | Specificity              | Recognition rate         |
|---------------|--------------------------|--------------------------|
| <b>Type A</b> | 100.0000 % (> 99.9798 %) | 100.0000 % (> 97.6923 %) |
| <b>Type B</b> | 100.0000 % (> 99.9655 %) | 100.0000 % (> 99.1429 %) |
| <b>Type C</b> | 100.0000 % (> 99.6849 %) | 99.2917 % (> 99.0985 %)  |

In order to ensure that each substance is entered with the same weight irrespective of the number of spectra available, each spectrum is weighted with the reciprocal value of its number. (If several new spectra of a substance with a very distinctive spectrum are added, the values for *specificity* and *recognition rate* are safer, but are by no means idealised.)

In order to illustrate the impact of the number of spectra, a comparison is made in parentheses as to how the *specificity* or *recognition rate* would worsen if three additional incorrect results were to exist amongst the spectra ([Rule of Three](#) [10, 11]). The larger the number of spectra, the lower the deterioration if the three hypothetical *incorrect results* were added.

Where the number of spectra does not exceed 20, no *recognition rate* is provided.

## Nearest chemometric neighbours

The following table lists the closest chemometric neighbours of the substance/substance group *Macrogols 400* in the substance class *APIs & excipients, liquid/semi-solid (with analysis certificate)*. Furthermore, their *Mahalanobis distance* is specified within the main model and, where appropriate, within the second-stage model.

| Substance         | Distance in<br>main model | Distance in<br>second-stage model |
|-------------------|---------------------------|-----------------------------------|
| Macrogols 300     | 18.09                     | —                                 |
| Macrogol ointment | 19.69                     | —                                 |
| Polysorbate 20    | 68.34                     | —                                 |

The list stops after the first substance with a *Mahalanobis distance* greater than 50. If the substance/substance group *Macrogols 400* is separated from critical neighbours in a second-stage model, all the remaining substances in the second-stage model follow.

### Identity according to identity test using NIR spectroscopy

For each substance, a certificate of the correct identity is obtained from an independent GMP-certified test laboratory. If the identity of the sample can be provided using NIR on an independently tested reference sample, in the following table the *Mahalanobis distance* to the reference sample is specified as well as the *Mahalanobis distance* to the next non-identical substance:

| Sample ID | Reference<br>sample ID | Distance to<br>reference sample | Distance to<br>next foreign sample |
|-----------|------------------------|---------------------------------|------------------------------------|
| 31149     | 31149                  | 0.00                            | 24.68                              |
| 31367     | 33057                  | 8.32                            | 21.09                              |
| 31814     | 31814                  | 0.00                            | 25.61                              |
| 32714     | 32714                  | 0.00                            | 23.28                              |
| 33057     | 33057                  | 0.00                            | 23.79                              |
| 34812     | 34812                  | 0.00                            | 27.74                              |

The identity of a sample will be confirmed by NIR if the distance to the next foreign sample is at least 50% greater than the distance to a reference sample whose identity has been established by laboratory testing. This criterion is always considered in the chemometric model, which contains all substances of the substance class, even if a second-stage dissolves a subgroup of similar substances, thereby increasing the distances between them. The samples confirmed by NIR support the statistical variance of the original reference substance, but cannot add new aspects or forms of the substance.

# VALIDATION REPORT

## IdentModule 2.4-2021-04

Validated substance/substance group **Mandarin oil**  
Substance class APIs & excipients, liquid/semi-solid (with analysis certificate)  
Report date 08/11/2021  
Report number 31747-2021-11-08  
Executing company HiperScan GmbH  
Weißeritzstraße 3  
01067 Dresden  
Germany

### Relevant substance names

Mandarin oil; Citri reticulatae aetheroleum

### Special notes

When selecting the *Mandarin oil* substance/substance group, the following information is displayed to the user:

*no information*

### Applicable documents

978-3-7692-7517-9 *European Pharmacopoeia 10th Edition, Basic Version 2020* [3]  
Komm2.2.40 *Erfüllung von Ph. Eur. 2.2.40 durch Apo-Ident* [4]  
AA004 *Erstellung und Validierung eines IdentModul-Updates*

### Validation method

Validation is performed after every change to the chemometric model (also “database”) in three steps:

1. The chemometric model is calculated from the calibration spectra using a *PCA algorithm*. The calibration spectra originate from the calibration samples of all substances in this class.
2. In the *chemometric model* generated, the distances between all separable substances are checked for compliance with the specified safety distances.
3. All spectra are presented to the generated chemometric model for evaluation. In three runs, the reference spectra (*Type A*), spectra from independent samples (*Type B*), and spectra from the field (*Type C*) are presented successively. Here, no single *false positive* result is permitted.

Finally, a report is generated from the validation run results and is archived together with the parameters of the model generation in audit-compliant manner.

### Number of independent samples (batches) in calibration and validation

A sample is considered independent if no sample from the same batch has been included in the calibration of the chemometric model.

| Substance/substance group | Type A | Type B | Type C |
|---------------------------|--------|--------|--------|
| Mandarin oil              | 2      | 2      | 7      |

## Second-stage model

For differentiation of the substance/substance group *Mandarin oil* the following second-stage model is used:

*no second-stage model*

## Calibration samples

Only spectra which have been recorded by *HiperScan GmbH* from traceable samples are used for the generation of the [chemometric models](#). The following samples have been obtained from the substance/substance group *Mandarin oil*:

| Supplier | Substance    | Batch    | Sample ID | Spectra | Certificate |
|----------|--------------|----------|-----------|---------|-------------|
| Caelo    | Mandarin oil | 14064103 | 31747     | 60      | 1602210     |
| Caelo    | Mandarin oil | 15398001 | 31863     | 60      | 20151127    |

## Validation samples

A total of 396 793 spectra were provided for validation. The results were evaluated separately according to the following sample categories:

**Type A** All calibration spectra.

- 120 spectra of 2 reference samples from the substance/substance group *Mandarin oil*. These samples are listed above in the [calibration samples](#) section. The reference samples come from 2 different batches.
- 63 819 spectra from a total of 1305 batches from further 223 substances. These spectra were recorded by *HiperScan GmbH*. *Type A* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type A* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix A](#). The samples in [Appendix A](#) were added for model generation not with the intention to have the model identify these substances, but with the intention to make the model reject them despite their similarity to substances identifiable.

**Type B** Spectra from independent samples not included in the database structure. Measurement is carried out by *HiperScan GmbH*.

Samples from batches of which no spectra have been included in the database structure are considered as independent samples. The number of batches from which independent samples supplied *Type B* spectra for validation is shown below, representing the number of independent *Type B* samples. Samples, of which some of the spectra have been included in the database structure and other spectra in the validation, are marked with a <sup>†</sup>. The following applies to the remaining unmarked samples: In the same batch, there was at least one additional sample (other sales container, other sample ID) from which reference spectra (*Type A*) were included in the database structure.

- 80 spectra of 2 reference samples from the substance/substance group *Mandarin oil*.
- Among them are spectra of independent samples from 2 batches from which no spectra have been included in the database structure. They are sorted upwards in the following table and separated from the additional samples by a line.

| Supplier | Substance    | Batch  | Sample ID | Spectra |
|----------|--------------|--------|-----------|---------|
| Caelo    | Mandarin oil | 170368 | 33074     | 40      |
| Caelo    | Mandarin oil | 180923 | 34055     | 40      |

- 91 411 spectra from a total of 2014 batches from further 345 substances. These spectra were recorded by *HiperScan GmbH*. *Type B* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type B* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix B](#).

**Type C** Spectra of independent samples not included in the database structure. *Apo-Ident* customers carry out the measurements. *HiperScan GmbH* generally does not verify the information provided by the customer regarding manufacturer and batch number.

- 22 spectra from 8 *Apo-Ident* customers from 8 batches from the substance/substance group *Mandarin oil*.
- Among them are spectra of independent samples from 7 batches from which no spectra have been included in the database structure. These are sorted upwards in the following table.

| Supplier | Substance    | Batch         | Spectra |
|----------|--------------|---------------|---------|
| Caelo    | Mandarin oil | 15011601      | 12      |
| Caelo    | Mandarin oil | 15398003      | 1       |
| Caelo    | Mandarin oil | 17036801      | 2       |
| Caelo    | Mandarin oil | 17361201      | 2       |
| Caelo    | Mandarin oil | 18092301      | 1       |
| Taoasis  | Mandarin oil | 412011-124957 | 1       |
| Taoasis  | Mandarin oil | 776-4175      | 2       |
| Caelo    | Mandarin oil | 15398001      | 1       |

- 241 341 spectra from 1121 *Apo-Ident* customers from a total of 46 998 batches from a further 342 substances. These spectra were recorded by *Apo-Ident* customers. *Type C* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type C* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix C](#).

## Validation results

The validation runs checked whether the substance/substance group *Mandarin oil* can clearly be distinguished from all other substances using NIR spectroscopy with *Apo-Ident*. For this purpose, all relevant spectra of the various substances were compared with *Mandarin oil* and it was evaluated how many matches (positive) and rejections (negative) were correct or incorrect. The following table breaks down the numbers of correct and incorrect results according to the expected result (*positive/negative*) and the validation spectrum type (*A/B/C*).

|               | False positive | True positive | False negative | True negative |
|---------------|----------------|---------------|----------------|---------------|
| <b>Type A</b> | 0              | 120           | 0              | 63 819        |
| <b>Type B</b> | 0              | 80            | 0              | 91 411        |
| <b>Type C</b> | 0              | 22            | 0              | 241 341       |

The substance/substance group *Mandarin oil* can be clearly distinguished from all other substances. In order to make these figures comparable, the weighted *true negative rate* (*specificity*) and the weighted *true positive rate* (*recognition rate*) are determined:

|               | Specificity              | Recognition rate         |
|---------------|--------------------------|--------------------------|
| <b>Type A</b> | 100.0000 % (> 99.9799 %) | 100.0000 % (> 95.0000 %) |
| <b>Type B</b> | 100.0000 % (> 99.9656 %) | 100.0000 % (> 92.5000 %) |
| <b>Type C</b> | 100.0000 % (> 99.6853 %) | 100.0000 % (> 72.7273 %) |

In order to ensure that each substance is entered with the same weight irrespective of the number of spectra available, each spectrum is weighted with the reciprocal value of its number. (If several

new spectra of a substance with a very distinctive spectrum are added, the values for *specificity* and *recognition rate* are safer, but are by no means idealised.)

In order to illustrate the impact of the number of spectra, a comparison is made in parentheses as to how the *specificity* or *recognition rate* would worsen if three additional incorrect results were to exist amongst the spectra (*Rule of Three* [10, 11]). The larger the number of spectra, the lower the deterioration if the three hypothetical *incorrect results* were added.

Where the number of spectra does not exceed 20, no *recognition rate* is provided.

### Nearest chemometric neighbours

The following table lists the closest chemometric neighbours of the substance/substance group *Mandarin oil* in the substance class *APIs & excipients, liquid/semi-solid (with analysis certificate)*. Furthermore, their *Mahalanobis distance* is specified within the main model and, where appropriate, within the second-stage model.

| Substance         | Distance in main model | Distance in second-stage model |
|-------------------|------------------------|--------------------------------|
| Bitter orange oil | 12.18                  | —                              |
| Grapefruit oil    | 21.58                  | —                              |
| Sweet orange oil  | 22.70                  | —                              |
| Citric oil        | 24.71                  | —                              |
| Caraway oil       | 49.61                  | —                              |
| Bergamot oil      | 95.16                  | —                              |

The list stops after the first substance with a *Mahalanobis distance* greater than 50. If the substance/substance group *Mandarin oil* is separated from critical neighbours in a second-stage model, all the remaining substances in the second-stage model follow.

### Identity according to identity test using NIR spectroscopy

For each substance, a certificate of the correct identity is obtained from an independent GMP-certified test laboratory. If the identity of the sample can be provided using NIR on an independently tested reference sample, in the following table the *Mahalanobis distance* to the reference sample is specified as well as the *Mahalanobis distance* to the next non-identical substance:

| Sample ID | Reference sample ID | Distance to reference sample | Distance to next foreign sample |
|-----------|---------------------|------------------------------|---------------------------------|
| 31747     | 31747               | 0.00                         | 20.36                           |
| 31863     | 31747               | 4.26                         | 19.37                           |

The identity of a sample will be confirmed by NIR if the distance to the next foreign sample is at least 50 % greater than the distance to a reference sample whose identity has been established by laboratory testing. This criterion is always considered in the chemometric model, which contains all substances of the substance class, even if a second-stage dissolves a subgroup of similar substances, thereby increasing the distances between them. The samples confirmed by NIR support the statistical variance of the original reference substance, but cannot add new aspects or forms of the substance.

# VALIDATION REPORT

## IdentModule 2.4-2021-04

|                                     |                                                                  |

### Relevant substance names

Matricaria oil, rich in (-)-alpha-bisabolol; Oleum chamomillae

### Special notes

When selecting the *Matricaria oil, rich in (-)-alpha-bisabolol* substance/substance group, the following information is displayed to the user:

*no information*

### Applicable documents

978-3-7692-7517-9 *European Pharmacopoeia 10th Edition, Basic Version 2020* [3]  
Komm2.2.40 *Erfüllung von Ph. Eur. 2.2.40 durch Apo-Ident* [4]  
AA004 *Erstellung und Validierung eines IdentModul-Updates*

### Validation method

Validation is performed after every change to the chemometric model (also “database”) in three steps:

1. The chemometric model is calculated from the calibration spectra using a *PCA algorithm*. The calibration spectra originate from the calibration samples of all substances in this class.
2. In the *chemometric model* generated, the distances between all separable substances are checked for compliance with the specified safety distances.
3. All spectra are presented to the generated chemometric model for evaluation. In three runs, the reference spectra (*Type A*), spectra from independent samples (*Type B*), and spectra from the field (*Type C*) are presented successively. Here, no single *false positive* result is permitted.

Finally, a report is generated from the validation run results and is archived together with the parameters of the model generation in audit-compliant manner.

### Number of independent samples (batches) in calibration and validation

A sample is considered independent if no sample from the same batch has been included in the calibration of the chemometric model.

| Substance/substance group                   | Type A | Type B | Type C |
|---------------------------------------------|--------|--------|--------|
| Matricaria oil, rich in (-)-alpha-bisabolol | 6      | 3      | 25     |

## Second-stage model

For differentiation of the substance/substance group *Matricaria oil, rich in (-)-alpha-bisabolol* the following second-stage model is used:

*no second-stage model*

## Calibration samples

Only spectra which have been recorded by *HiperScan GmbH* from traceable samples are used for the generation of the [chemometric models](#). The following samples have been obtained from the substance/substance group *Matricaria oil, rich in (-)-alpha-bisabolol*:

| Supplier | Substance           | Batch    | Sample ID | Spectra | Certificate |
|----------|---------------------|----------|-----------|---------|-------------|
| Caelo    | Matricaria oil, ... | 11221206 | 30738     | 40      | 20110810    |
| Caelo    | Matricaria oil, ... | 13195103 | 31239     | 30      | 1504133     |
| Caelo    | Matricaria oil, ... | 13334702 | 31427     | 60      | 20131009    |
| Caelo    | Matricaria oil, ... | 13334702 | 31428     | 60      | 20131009    |
| Caelo    | Matricaria oil, ... | 190925   | 34442     | 40      | 20190405*   |
| Caelo    | Matricaria oil, ... | 19000642 | 35726     | 50      | 20191216*   |
| Caelo    | Matricaria oil, ... | 20003048 | 35727     | 50      | 20201016*   |

## Validation samples

A total of 396 793 spectra were provided for validation. The results were evaluated separately according to the following sample categories:

**Type A** All calibration spectra.

- 330 spectra of 7 reference samples from the substance/substance group *Matricaria oil, rich in (-)-alpha-bisabolol*. These samples are listed above in the [calibration samples](#) section. The reference samples come from 6 different batches.
- 63 609 spectra from a total of 1301 batches from further 223 substances. These spectra were recorded by *HiperScan GmbH*. *Type A* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type A* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix A](#). The samples in [Appendix A](#) were added for model generation not with the intention to have the model identify these substances, but with the intention to make the model reject them despite their similarity to substances identifiable.

**Type B** Spectra from independent samples not included in the database structure. Measurement is carried out by *HiperScan GmbH*.

Samples from batches of which no spectra have been included in the database structure are considered as independent samples. The number of batches from which independent samples supplied *Type B* spectra for validation is shown below, representing the number of independent *Type B* samples. Samples, of which some of the spectra have been included in the database structure and other spectra in the validation, are marked with a <sup>†</sup>. The following applies to the remaining unmarked samples: In the same batch, there was at least one additional sample (other sales container, other sample ID) from which reference spectra (*Type A*) were included in the database structure.

- 100 spectra of 3 reference samples from the substance/substance group *Matricaria oil, rich in (-)-alpha-bisabolol*.

\*The spectra were taken from a part of the same sample which the supplier used for its analysis (identity, purity, content). In this case the manufacturer certificates proof the identity and quality of the sample from those the spectra descend.

- Among them are spectra of independent samples from 3 batches from which no spectra have been included in the database structure. They are sorted upwards in the following table and separated from the additional samples by a line.

| Supplier | Substance                       | Batch    | Sample ID | Spectra |
|----------|---------------------------------|----------|-----------|---------|
| Caelo    | Matricaria oil, rich in (-)-... | 13195101 | 31160     | 20      |
| Caelo    | Matricaria oil, rich in (-)-... | 163310   | 33081     | 40      |
| Caelo    | Matricaria oil, rich in (-)-... | 181173   | 34072     | 40      |

- 91 391 spectra from a total of 2013 batches from further 345 substances. These spectra were recorded by *HiperScan GmbH*. *Type B* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type B* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix B](#).

**Type C** Spectra of independent samples not included in the database structure. *Apo-Ident* customers carry out the measurements. *HiperScan GmbH* generally does not verify the information provided by the customer regarding manufacturer and batch number.

- 37 spectra from 14 *Apo-Ident* customers from 25 batches from the substance/substance group *Matricaria oil, rich in (-)-alpha-bisabolol*.
- Among them are spectra of independent samples from 25 batches from which no spectra have been included in the database structure. These are sorted upwards in the following table.

| Supplier             | Substance                       | Batch             | Spectra |
|----------------------|---------------------------------|-------------------|---------|
| Caelo                | Matricaria oil, rich in (-)-... | 20003048001       | 1       |

| Caesar & Loretz GmbH | Matricaria oil, rich in (-)-... | 18117302          | 1       |
| Caesar & Loretz GmbH | Matricaria oil, rich in (-)-... | 18117306          | 1       |
| Taoasis              | Matricaria oil, rich in (-)-... | 929-115334        | 1       |
| Taoasis              | Matricaria oil, rich in (-)-... | 16266-119132      | 1       |
| Taoasis              | Matricaria oil, rich in (-)-... | 6181024-121466    | 1       |
| Taoasis              | Matricaria oil, rich in (-)-... | 6181024-122141    | 1       |
| Taoasis              | Matricaria oil, rich in (-)-... | 6181024-123770    | 1       |
| Taoasis              | Matricaria oil, rich in (-)-... | 6181024-123496    | 1       |
| Taoasis              | Matricaria oil, rich in (-)-... | 2017100477-128584 | 1       |

- 241 326 spectra from 1121 *Apo-Ident* customers from a total of 46 981 batches from a further

342 substances. These spectra were recorded by *Apo-Ident* customers. *Type C* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type C* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix C](#).

## Validation results

The validation runs checked whether the substance/substance group *Matricaria oil, rich in (-)-alpha-bisabolol* can clearly be distinguished from all other substances using NIR spectroscopy with *Apo-Ident*. For this purpose, all relevant spectra of the various substances were compared with *Matricaria oil, rich in (-)-alpha-bisabolol* and it was evaluated how many matches (positive) and rejections (negative) were correct or incorrect. The following table breaks down the numbers of correct and incorrect results according to the expected result (*positive/negative*) and the validation spectrum type (*A/B/C*).

|        | False positive | True positive | False negative | True negative |
|--------|----------------|---------------|----------------|---------------|
| Type A | 0              | 330           | 0              | 63 609        |
| Type B | 0              | 100           | 0              | 91 391        |
| Type C | 0              | 37            | 0              | 241 326       |

The substance/substance group *Matricaria oil, rich in (-)-alpha-bisabolol* can be clearly distinguished from all other substances. In order to make these figures comparable, the weighted *true negative rate* (*specificity*) and the weighted *true positive rate* (*recognition rate*) are determined:

|        | Specificity              | Recognition rate         |
|--------|--------------------------|--------------------------|
| Type A | 100.0000 % (> 99.9797 %) | 100.0000 % (> 98.1818 %) |
| Type B | 100.0000 % (> 99.9656 %) | 100.0000 % (> 94.0000 %) |
| Type C | 100.0000 % (> 99.6851 %) | 100.0000 % (> 83.7838 %) |

In order to ensure that each substance is entered with the same weight irrespective of the number of spectra available, each spectrum is weighted with the reciprocal value of its number. (If several new spectra of a substance with a very distinctive spectrum are added, the values for *specificity* and *recognition rate* are safer, but are by no means idealised.)

In order to illustrate the impact of the number of spectra, a comparison is made in parentheses as to how the *specificity* or *recognition rate* would worsen if three additional incorrect results were to exist amongst the spectra ([Rule of Three](#) [10, 11]). The larger the number of spectra, the lower the deterioration if the three hypothetical *incorrect results* were added.

Where the number of spectra does not exceed 20, no *recognition rate* is provided.

## Nearest chemometric neighbours

The following table lists the closest chemometric neighbours of the substance/substance group *Matricaria oil, rich in (-)-alpha-bisabolol* in the substance class *APIs & excipients, liquid/semi-solid (with analysis certificate)*. Furthermore, their *Mahalanobis distance* is specified within the main model and, where appropriate, within the second-stage model.

| Substance                     | Distance in main model | Distance in second-stage model |
|-------------------------------|------------------------|--------------------------------|
| Verbena oil, nature-identical | 30.57                  | —                              |
| Geranium oil, genuine         | 38.09                  | —                              |
| Tea tree oil                  | 46.63                  | —                              |
| Acorus oil                    | 52.03                  | —                              |

The list stops after the first substance with a *Mahalanobis distance* greater than 50. If the substance/substance group *Matricaria oil, rich in (-)-alpha-bisabolol* is separated from critical neighbours in a second-stage model, all the remaining substances in the second-stage model follow.

### Identity according to identity test using NIR spectroscopy

For each substance, a certificate of the correct identity is obtained from an independent GMP-certified test laboratory. If the identity of the sample can be provided using NIR on an independently tested reference sample, in the following table the *Mahalanobis distance* to the reference sample is specified as well as the *Mahalanobis distance* to the next non-identical substance:

| Sample ID | Reference sample ID | Distance to reference sample | Distance to next foreign sample |
|-----------|---------------------|------------------------------|---------------------------------|
| 30738     | 34442               | 3.95                         | 24.10                           |
| 31239     | 31239               | 0.00                         | 27.88                           |
| 31427     | 31239               | 6.22                         | 22.14                           |
| 31428     | 31239               | 6.42                         | 22.03                           |
| 34442     | 34442               | 0.00                         | 21.43                           |
| 35726     | 35726               | 0.00                         | 26.41                           |
| 35727     | 35727               | 0.00                         | 30.76                           |

The identity of a sample will be confirmed by NIR if the distance to the next foreign sample is at least 50 % greater than the distance to a reference sample whose identity has been established by laboratory testing. This criterion is always considered in the chemometric model, which contains all substances of the substance class, even if a second-stage dissolves a subgroup of similar substances, thereby increasing the distances between them. The samples confirmed by NIR support the statistical variance of the original reference substance, but cannot add new aspects or forms of the substance.

# VALIDATION REPORT

## IdentModule 2.4-2021-04

Validated substance/substance group **Melissa oil**  
Substance class APIs & excipients, liquid/semi-solid (with analysis certificate)  
Report date 08/11/2021  
Report number 30207-2021-11-08  
Executing company HiperScan GmbH  
Weißeritzstraße 3  
01067 Dresden  
Germany

### Relevant substance names

Melissa oil; Oleum melissae rectific.

### Special notes

When selecting the *Melissa oil* substance/substance group, the following information is displayed to the user:

*no information*

### Applicable documents

978-3-7692-7517-9 *European Pharmacopoeia 10th Edition, Basic Version 2020* [3]  
Komm2.2.40 *Erfüllung von Ph. Eur. 2.2.40 durch Apo-Ident* [4]  
AA004 *Erstellung und Validierung eines IdentModul-Updates*

### Validation method

Validation is performed after every change to the chemometric model (also “database”) in three steps:

1. The chemometric model is calculated from the calibration spectra using a *PCA algorithm*. The calibration spectra originate from the calibration samples of all substances in this class.
2. In the *chemometric model* generated, the distances between all separable substances are checked for compliance with the specified safety distances.
3. All spectra are presented to the generated chemometric model for evaluation. In three runs, the reference spectra (*Type A*), spectra from independent samples (*Type B*), and spectra from the field (*Type C*) are presented successively. Here, no single *false positive* result is permitted.

Finally, a report is generated from the validation run results and is archived together with the parameters of the model generation in audit-compliant manner.

### Number of independent samples (batches) in calibration and validation

A sample is considered independent if no sample from the same batch has been included in the calibration of the chemometric model.

| Substance/substance group | Type A | Type B | Type C |
|---------------------------|--------|--------|--------|
| Melissa oil               | 4      | 2      | 64     |

## Second-stage model

For differentiation of the substance/substance group *Melissa oil* the following second-stage model is used:

*no second-stage model*

## Calibration samples

Only spectra which have been recorded by *HiperScan GmbH* from traceable samples are used for the generation of the [chemometric models](#). The following samples have been obtained from the substance/substance group *Melissa oil*:

| Supplier | Substance   | Batch    | Sample ID | Spectra | Certificate |
|----------|-------------|----------|-----------|---------|-------------|
| Caelo    | Melissa oil | 13086306 | 31163     | 40      | 1403319     |
| Caelo    | Melissa oil | 13354110 | 31403     | 40      | 20131028    |
| Caelo    | Melissa oil | 163349   | 33080     | 40      | 20161215*   |
| Caelo    | Melissa oil | 183300   | 34641     | 40      | 20181221*   |

## Validation samples

A total of 396 793 spectra were provided for validation. The results were evaluated separately according to the following sample categories:

**Type A** All calibration spectra.

- 160 spectra of 4 reference samples from the substance/substance group *Melissa oil*. These samples are listed above in the [calibration samples](#) section. The reference samples come from 4 different batches.
- 63 779 spectra from a total of 1303 batches from further 223 substances. These spectra were recorded by *HiperScan GmbH*. *Type A* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type A* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix A](#). The samples in [Appendix A](#) were added for model generation not with the intention to have the model identify these substances, but with the intention to make the model reject them despite their similarity to substances identifiable.

**Type B** Spectra from independent samples not included in the database structure. Measurement is carried out by *HiperScan GmbH*.

Samples from batches of which no spectra have been included in the database structure are considered as independent samples. The number of batches from which independent samples supplied *Type B* spectra for validation is shown below, representing the number of independent *Type B* samples. Samples, of which some of the spectra have been included in the database structure and other spectra in the validation, are marked with a <sup>†</sup>. The following applies to the remaining unmarked samples: In the same batch, there was at least one additional sample (other sales container, other sample ID) from which reference spectra (*Type A*) were included in the database structure.

- 80 spectra of 2 reference samples from the substance/substance group *Melissa oil*.
- Among them are spectra of independent samples from 2 batches from which no spectra have been included in the database structure. They are sorted upwards in the following table and separated from the additional samples by a line.

\*The spectra were taken from a part of the same sample which the supplier used for its analysis (identity, purity, content). In this case the manufacturer certificates proof the identity and quality of the sample from those the spectra descend.

| Supplier | Substance   | Batch    | Sample ID | Spectra |
|----------|-------------|----------|-----------|---------|
| Caelo    | Melissa oil | 16053609 | 33784     | 40      |
| Caelo    | Melissa oil | 180973   | 34084     | 40      |

- 91 411 spectra from a total of 2014 batches from further 345 substances. These spectra were recorded by *HiperScan GmbH*. *Type B* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type B* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix B](#).

**Type C** Spectra of independent samples not included in the database structure. *Apo-Ident* customers carry out the measurements. *HiperScan GmbH* generally does not verify the information provided by the customer regarding manufacturer and batch number.

- 246 spectra from 106 *Apo-Ident* customers from 67 batches from the substance/substance group *Melissa oil*.
- Among them are spectra of independent samples from 64 batches from which no spectra have been included in the database structure. These are sorted upwards in the following table.

| Supplier                   | Substance   | Batch             | Spectra |

- 241 117 spectra from 1121 *Apo-Ident* customers from a total of 46 943 batches from a further 342 substances. These spectra were recorded by *Apo-Ident* customers. *Type C* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type C* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix C](#).

## Validation results

The validation runs checked whether the substance/substance group *Melissa oil* can clearly be distinguished from all other substances using NIR spectroscopy with *Apo-Ident*. For this purpose, all relevant spectra of the various substances were compared with *Melissa oil* and it was evaluated how

many matches (positive) and rejections (negative) were correct or incorrect. The following table breaks down the numbers of correct and incorrect results according to the expected result (*positive/negative*) and the validation spectrum type (*A/B/C*).

|               | False positive | True positive | False negative | True negative |
|---------------|----------------|---------------|----------------|---------------|
| <b>Type A</b> | 0              | 160           | 0              | 63 779        |
| <b>Type B</b> | 0              | 80            | 0              | 91 411        |
| <b>Type C</b> | 0              | 244           | 2              | 241 117       |

The substance/substance group *Melissa oil* can be clearly distinguished from all other substances. In order to make these figures comparable, the weighted *true negative rate (specificity)* and the weighted *true positive rate (recognition rate)* are determined:

|               | Specificity              | Recognition rate         |
|---------------|--------------------------|--------------------------|
| <b>Type A</b> | 100.0000 % (> 99.9798 %) | 100.0000 % (> 96.2500 %) |
| <b>Type B</b> | 100.0000 % (> 99.9656 %) | 100.0000 % (> 92.5000 %) |
| <b>Type C</b> | 100.0000 % (> 99.6849 %) | 99.1870 % (> 97.9675 %)  |

In order to ensure that each substance is entered with the same weight irrespective of the number of spectra available, each spectrum is weighted with the reciprocal value of its number. (If several new spectra of a substance with a very distinctive spectrum are added, the values for *specificity* and *recognition rate* are safer, but are by no means idealised.)

In order to illustrate the impact of the number of spectra, a comparison is made in parentheses as to how the *specificity* or *recognition rate* would worsen if three additional incorrect results were to exist amongst the spectra (*Rule of Three* [10, 11]). The larger the number of spectra, the lower the deterioration if the three hypothetical *incorrect results* were added.

Where the number of spectra does not exceed 20, no *recognition rate* is provided.

### Nearest chemometric neighbours

The following table lists the closest chemometric neighbours of the substance/substance group *Melissa oil* in the substance class *APIs & excipients, liquid/semi-solid (with analysis certificate)*. Furthermore, their *Mahalanobis distance* is specified within the main model and, where appropriate, within the second-stage model.

| Substance         | Distance in main model | Distance in second-stage model |
|-------------------|------------------------|--------------------------------|
| Citronella oil    | 40.30                  | –                              |
| Tea tree oil      | 44.69                  | –                              |
| Bitter orange oil | 50.34                  | –                              |

The list stops after the first substance with a *Mahalanobis distance* greater than 50. If the substance/substance group *Melissa oil* is separated from critical neighbours in a second-stage model, all the remaining substances in the second-stage model follow.

### Identity according to identity test using NIR spectroscopy

For each substance, a certificate of the correct identity is obtained from an independent GMP-certified test laboratory. If the identity of the sample can be provided using NIR on an independently tested reference sample, in the following table the *Mahalanobis distance* to the reference sample is specified as well as the *Mahalanobis distance* to the next non-identical substance:

| Sample ID | Reference sample ID | Distance to reference sample | Distance to next foreign sample |
|-----------|---------------------|------------------------------|---------------------------------|
| 31163     | 31163               | 0.00                         | 50.42                           |
| 31403     | 31163               | 4.81                         | 48.03                           |

*continued on the next page*

*continued from previous page*

| <b>Sample ID</b> | <b>Reference<br/>sample ID</b> | <b>Distance to<br/>reference sample</b> | <b>Distance to<br/>next foreign sample</b> |
|------------------|--------------------------------|-----------------------------------------|--------------------------------------------|
| 33080            | 33080                          | 0.00                                    | 51.28                                      |
| 34641            | 34641                          | 0.00                                    | 51.60                                      |

The identity of a sample will be confirmed by NIR if the distance to the next foreign sample is at least 50 % greater than the distance to a reference sample whose identity has been established by laboratory testing. This criterion is always considered in the chemometric model, which contains all substances of the substance class, even if a second-stage dissolves a subgroup of similar substances, thereby increasing the distances between them. The samples confirmed by NIR support the statistical variance of the original reference substance, but cannot add new aspects or forms of the substance.

# VALIDATION REPORT

## IdentModule 2.4-2021-04

Validated substance/substance group **Methyl salicylate**  
Substance class APIs & excipients, liquid/semi-solid (with analysis certificate)  
Report date 08/11/2021  
Report number 31038-2021-11-08  
Executing company HiperScan GmbH  
Weißeritzstraße 3  
01067 Dresden  
Germany

### Relevant substance names

Methyl salicylate; Methylum salicylicum

### Special notes

When selecting the *Methyl salicylate* substance/substance group, the following information is displayed to the user:

*no information*

### Applicable documents

978-3-7692-7517-9 *European Pharmacopoeia 10th Edition, Basic Version 2020* [3]  
Komm2.2.40 *Erfüllung von Ph. Eur. 2.2.40 durch Apo-Ident* [4]  
AA004 *Erstellung und Validierung eines IdentModul-Updates*

### Validation method

Validation is performed after every change to the chemometric model (also “database”) in three steps:

1. The chemometric model is calculated from the calibration spectra using a *PCA algorithm*. The calibration spectra originate from the calibration samples of all substances in this class.
2. In the *chemometric model* generated, the distances between all separable substances are checked for compliance with the specified safety distances.
3. All spectra are presented to the generated chemometric model for evaluation. In three runs, the reference spectra (*Type A*), spectra from independent samples (*Type B*), and spectra from the field (*Type C*) are presented successively. Here, no single *false positive* result is permitted.

Finally, a report is generated from the validation run results and is archived together with the parameters of the model generation in audit-compliant manner.

### Number of independent samples (batches) in calibration and validation

A sample is considered independent if no sample from the same batch has been included in the calibration of the chemometric model.

| Substance/substance group | Type A | Type B | Type C |
|---------------------------|--------|--------|--------|
| Methyl salicylate         | 4      | 3      | 65     |

## Second-stage model

For differentiation of the substance/substance group *Methyl salicylate* the following second-stage model is used:

*no second-stage model*

## Calibration samples

Only spectra which have been recorded by *HiperScan GmbH* from traceable samples are used for the generation of the [chemometric models](#). The following samples have been obtained from the substance/substance group *Methyl salicylate*:

| Supplier | Substance         | Batch            | Sample ID | Spectra | Certificate |
|----------|-------------------|------------------|-----------|---------|-------------|
| Caelo    | Methyl salicylate | 12215217         | 31038     | 40      | 1403162     |
| Caelo    | Methyl salicylate | 15409810         | 33280     | 40      | 20160118    |
| Fagron   | Methyl salicylate | 14D03-B04-294169 | 31607     | 60      | 20140414    |
| Fagron   | Methyl salicylate | 16E23-B05-332971 | 33275     | 40      | 20160608    |

## Validation samples

A total of 396 793 spectra were provided for validation. The results were evaluated separately according to the following sample categories:

### Type A All calibration spectra.

- 180 spectra of 4 reference samples from the substance/substance group *Methyl salicylate*. These samples are listed above in the [calibration samples](#) section. The reference samples come from 4 different batches.
- 63 759 spectra from a total of 1303 batches from further 223 substances. These spectra were recorded by *HiperScan GmbH*. *Type A* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type A* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix A](#). The samples in [Appendix A](#) were added for model generation not with the intention to have the model identify these substances, but with the intention to make the model reject them despite their similarity to substances identifiable.

**Type B** Spectra from independent samples not included in the database structure. Measurement is carried out by *HiperScan GmbH*.

Samples from batches of which no spectra have been included in the database structure are considered as independent samples. The number of batches from which independent samples supplied *Type B* spectra for validation is shown below, representing the number of independent *Type B* samples. Samples, of which some of the spectra have been included in the database structure and other spectra in the validation, are marked with a <sup>†</sup>. The following applies to the remaining unmarked samples: In the same batch, there was at least one additional sample (other sales container, other sample ID) from which reference spectra (*Type A*) were included in the database structure.

- 120 spectra of 3 reference samples from the substance/substance group *Methyl salicylate*.
- Among them are spectra of independent samples from 3 batches from which no spectra have been included in the database structure. They are sorted upwards in the following table and separated from the additional samples by a line.

| Supplier | Substance         | Batch            | Sample ID | Spectra |
|----------|-------------------|------------------|-----------|---------|
| Caelo    | Methyl salicylate | 192086           | 34728     | 40      |
| Fagron   | Methyl salicylate | 18B19-B06-346255 | 34047     | 40      |
| Fagron   | Methyl salicylate | 20C03-F04-374159 | 35460     | 40      |

- 91 371 spectra from a total of 2013 batches from further 345 substances. These spectra were recorded by *HiperScan GmbH*. *Type B* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type B* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix B](#).

**Type C** Spectra of independent samples not included in the database structure. *Apo-Ident* customers carry out the measurements. *HiperScan GmbH* generally does not verify the information provided by the customer regarding manufacturer and batch number.

- 111 spectra from 66 *Apo-Ident* customers from 69 batches from the substance/substance group *Methyl salicylate*.
- Among them are spectra of independent samples from 66 batches from which no spectra have been included in the database structure. These are sorted upwards in the following table.

| Supplier                   | Substance         | Batch            | Spectra |
|----------------------------|-------------------|------------------|---------|

- 241 252 spectra from 1121 *Apo-Ident* customers from a total of 46 939 batches from a further 342 substances. These spectra were recorded by *Apo-Ident* customers. *Type C* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type C* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix C](#).

## Validation results

The validation runs checked whether the substance/substance group *Methyl salicylate* can clearly be distinguished from all other substances using NIR spectroscopy with *Apo-Ident*. For this purpose, all relevant spectra of the various substances were compared with *Methyl salicylate* and it was evaluated how many matches (positive) and rejections (negative) were correct or incorrect. The following table breaks down the numbers of correct and incorrect results according to the expected result (*positive/negative*) and the validation spectrum type (*A/B/C*).

|        | False positive | True positive | False negative | True negative |
|--------|----------------|---------------|----------------|---------------|
| Type A | 0              | 180           | 0              | 63 759        |
| Type B | 0              | 120           | 0              | 91 371        |
| Type C | 0              | 111           | 0              | 241 252       |

The substance/substance group *Methyl salicylate* can be clearly distinguished from all other substances. In order to make these figures comparable, the weighted *true negative rate* (*specificity*) and the weighted *true positive rate* (*recognition rate*) are determined:

|               | <b>Specificity</b>       | <b>Recognition rate</b>  |
|---------------|--------------------------|--------------------------|
| <b>Type A</b> | 100.0000 % (> 99.9798 %) | 100.0000 % (> 96.6667 %) |
| <b>Type B</b> | 100.0000 % (> 99.9656 %) | 100.0000 % (> 95.0000 %) |
| <b>Type C</b> | 100.0000 % (> 99.6849 %) | 100.0000 % (> 94.5946 %) |

In order to ensure that each substance is entered with the same weight irrespective of the number of spectra available, each spectrum is weighted with the reciprocal value of its number. (If several new spectra of a substance with a very distinctive spectrum are added, the values for *specificity* and *recognition rate* are safer, but are by no means idealised.)

In order to illustrate the impact of the number of spectra, a comparison is made in parentheses as to how the *specificity* or *recognition rate* would worsen if three additional incorrect results were to exist amongst the spectra (*Rule of Three* [10, 11]). The larger the number of spectra, the lower the deterioration if the three hypothetical *incorrect results* were added.

Where the number of spectra does not exceed 20, no *recognition rate* is provided.

### Nearest chemometric neighbours

The following table lists the closest chemometric neighbours of the substance/substance group *Methyl salicylate* in the substance class *APIs & excipients, liquid/semi-solid (with analysis certificate)*. Furthermore, their *Mahalanobis distance* is specified within the main model and, where appropriate, within the second-stage model.

| <b>Substance</b>        | <b>Distance in main model</b> | <b>Distance in second-stage model</b> |
|-------------------------|-------------------------------|---------------------------------------|
| Hydroxyethyl salicylate | 104.11                        | –                                     |

The list stops after the first substance with a *Mahalanobis distance* greater than 50. If the substance/substance group *Methyl salicylate* is separated from critical neighbours in a second-stage model, all the remaining substances in the second-stage model follow.

### Identity according to identity test using NIR spectroscopy

For each substance, a certificate of the correct identity is obtained from an independent GMP-certified test laboratory. If the identity of the sample can be provided using NIR on an independently tested reference sample, in the following table the *Mahalanobis distance* to the reference sample is specified as well as the *Mahalanobis distance* to the next non-identical substance:

| <b>Sample ID</b> | <b>Reference sample ID</b> | <b>Distance to reference sample</b> | <b>Distance to next foreign sample</b> |
|------------------|----------------------------|-------------------------------------|----------------------------------------|
| 31038            | 31038                      | 0.00                                | 152.96                                 |
| 31607            | 31038                      | 5.88                                | 154.40                                 |
| 33275            | 31038                      | 2.32                                | 154.05                                 |
| 33280            | 31038                      | 2.76                                | 153.08                                 |

The identity of a sample will be confirmed by NIR if the distance to the next foreign sample is at least 50 % greater than the distance to a reference sample whose identity has been established by laboratory testing. This criterion is always considered in the chemometric model, which contains all substances of the substance class, even if a second-stage dissolves a subgroup of similar substances, thereby increasing the distances between them. The samples confirmed by NIR support the statistical variance of the original reference substance, but cannot add new aspects or forms of the substance.

# VALIDATION REPORT

## IdentModule 2.4-2021-04

Validated substance/substance group **Metronidazole 25% in white petrolatum**  
Substance class APIs & excipients, liquid/semi-solid (with analysis certificate)  
Report date 08/11/2021  
Report number 30663-2021-11-08  
Executing company HiperScan GmbH  
Weißeritzstraße 3  
01067 Dresden  
Germany

### Relevant substance names

Metronidazole 25% in white petrolatum

### Special notes

When selecting the *Metronidazole 25% in white petrolatum* substance/substance group, the following information is displayed to the user:

*no information*

### Applicable documents

978-3-7692-7517-9 *European Pharmacopoeia 10th Edition, Basic Version 2020* [3]  
Komm2.2.40 *Erfüllung von Ph. Eur. 2.2.40 durch Apo-Ident* [4]  
AA004 *Erstellung und Validierung eines IdentModul-Updates*

### Validation method

Validation is performed after every change to the chemometric model (also “database”) in three steps:

1. The chemometric model is calculated from the calibration spectra using a *PCA algorithm*. The calibration spectra originate from the calibration samples of all substances in this class.
2. In the *chemometric model* generated, the distances between all separable substances are checked for compliance with the specified safety distances.
3. All spectra are presented to the generated chemometric model for evaluation. In three runs, the reference spectra (*Type A*), spectra from independent samples (*Type B*), and spectra from the field (*Type C*) are presented successively. Here, no single *false positive* result is permitted.

Finally, a report is generated from the validation run results and is archived together with the parameters of the model generation in audit-compliant manner.

### Number of independent samples (batches) in calibration and validation

A sample is considered independent if no sample from the same batch has been included in the calibration of the chemometric model.

| Substance/substance group             | Type A | Type B | Type C |
|---------------------------------------|--------|--------|--------|
| Metronidazole 25% in white petrolatum | 3      | 1      | 13     |

## Second-stage model

For differentiation of the substance/substance group *Metronidazole 25% in white petrolatum* the following second-stage model is used:

*no second-stage model*

## Calibration samples

Only spectra which have been recorded by *HiperScan GmbH* from traceable samples are used for the generation of the [chemometric models](#). The following samples have been obtained from the substance/substance group *Metronidazole 25% in white petrolatum*:

| Supplier | Substance           | Batch    | Sample ID | Spectra | Certificate |
|----------|---------------------|----------|-----------|---------|-------------|
| Caelo    | Metronidazole 25... | 12266401 | 30663     | 40      | 1405100     |
| Caelo    | Metronidazole 25... | 14116801 | 31316     | 40      | 20140411    |
| Caelo    | Metronidazole 25... | 16063101 | 32456     | 40      | 20160229    |
| Caelo    | Metronidazole 25... | 16063101 | 32768     | 40      | 20160229    |

## Validation samples

A total of 396 793 spectra were provided for validation. The results were evaluated separately according to the following sample categories:

**Type A** All calibration spectra.

- 160 spectra of 4 reference samples from the substance/substance group *Metronidazole 25% in white petrolatum*. These samples are listed above in the [calibration samples](#) section. The reference samples come from 3 different batches.
- 63 779 spectra from a total of 1304 batches from further 223 substances. These spectra were recorded by *HiperScan GmbH*. *Type A* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type A* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix A](#). The samples in [Appendix A](#) were added for model generation not with the intention to have the model identify these substances, but with the intention to make the model reject them despite their similarity to substances identifiable.

**Type B** Spectra from independent samples not included in the database structure. Measurement is carried out by *HiperScan GmbH*.

Samples from batches of which no spectra have been included in the database structure are considered as independent samples. The number of batches from which independent samples supplied *Type B* spectra for validation is shown below, representing the number of independent *Type B* samples. Samples, of which some of the spectra have been included in the database structure and other spectra in the validation, are marked with a <sup>†</sup>. The following applies to the remaining unmarked samples: In the same batch, there was at least one additional sample (other sales container, other sample ID) from which reference spectra (*Type A*) were included in the database structure.

- 40 spectra of 1 reference samples from the substance/substance group *Metronidazole 25% in white petrolatum*.
- Among them are spectra of independent samples from 1 batches from which no spectra have been included in the database structure. They are sorted upwards in the following table and separated from the additional samples by a line.

| Supplier | Substance                       | Batch    | Sample ID | Spectra |
|----------|---------------------------------|----------|-----------|---------|
| Caelo    | Metronidazole 25% in white p... | 16249701 | 33272     | 40      |

- 91 451 spectra from a total of 2015 batches from further 345 substances. These spectra were recorded by *HiperScan GmbH*. *Type B* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type B* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix B](#).

**Type C** Spectra of independent samples not included in the database structure. *Apo-Ident* customers carry out the measurements. *HiperScan GmbH* generally does not verify the information provided by the customer regarding manufacturer and batch number.

- 57 spectra from 20 *Apo-Ident* customers from 15 batches from the substance/substance group *Metronidazole 25% in white petrolatum*.
- Among them are spectra of independent samples from 13 batches from which no spectra have been included in the database structure. These are sorted upwards in the following table.

| Supplier                 | Substance                       | Batch    | Spectra |
|--------------------------|---------------------------------|----------|---------|
| Cael Sanacorp 05.02.2016 | Metronidazole 25% in white p... | 15207101 | 1       |
| Caelo                    | Metronidazole 25% in white p... | 14024301 | 4       |
| Caelo                    | Metronidazole 25% in white p... | 14209301 | 1       |
| Caelo                    | Metronidazole 25% in white p... | 13077601 | 3       |
| Caelo                    | Metronidazole 25% in white p... | 1285301  | 1       |

| GEHE/26.02.2013          | Metronidazole 25% in white p... | 12306601 | 1       |
| Noweda 20.02.2015        | Metronidazole 25% in white p... | 14247301 | 1       |
| Phoenix                  | Metronidazole 25% in white p... | 16249701 | 1       |
| Sanacorp                 | Metronidazole 25% in white p... | 12306601 | 1       |
| Caelo                    | Metronidazole 25% in white p... | 14116801 | 3       |
| Caelo                    | Metronidazole 25% in white p... | 16063101 | 10      |

- 241 306 spectra from 1121 *Apo-Ident* customers from a total of 46 991 batches from a further 342 substances. These spectra were recorded by *Apo-Ident* customers. *Type C* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type C* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix C](#).

## Validation results

The validation runs checked whether the substance/substance group *Metronidazole 25% in white petrolatum* can clearly be distinguished from all other substances using NIR spectroscopy with *Apo-Ident*. For this purpose, all relevant spectra of the various substances were compared with *Metronidazole 25% in white petrolatum* and it was evaluated how many matches (positive) and rejections (negative) were correct or incorrect. The following table breaks down the numbers of correct and

incorrect results according to the expected result (*positive/negative*) and the validation spectrum type (*A/B/C*).

|        | False positive | True positive | False negative | True negative |
|--------|----------------|---------------|----------------|---------------|
| Type A | 0              | 160           | 0              | 63 779        |
| Type B | 0              | 40            | 0              | 91 451        |
| Type C | 0              | 56            | 1              | 241 306       |

The substance/substance group *Metronidazole 25% in white petrolatum* can be clearly distinguished from all other substances. In order to make these figures comparable, the weighted *true negative rate* (*specificity*) and the weighted *true positive rate* (*recognition rate*) are determined:

|        | Specificity              | Recognition rate         |
|--------|--------------------------|--------------------------|
| Type A | 100.0000 % (> 99.9798 %) | 100.0000 % (> 96.2500 %) |
| Type B | 100.0000 % (> 99.9658 %) | 100.0000 % (> 85.0000 %) |
| Type C | 100.0000 % (> 99.6850 %) | 98.2456 % (> 92.9825 %)  |

In order to ensure that each substance is entered with the same weight irrespective of the number of spectra available, each spectrum is weighted with the reciprocal value of its number. (If several new spectra of a substance with a very distinctive spectrum are added, the values for *specificity* and *recognition rate* are safer, but are by no means idealised.)

In order to illustrate the impact of the number of spectra, a comparison is made in parentheses as to how the *specificity* or *recognition rate* would worsen if three additional incorrect results were to exist amongst the spectra (*Rule of Three* [10, 11]). The larger the number of spectra, the lower the deterioration if the three hypothetical *incorrect results* were added.

Where the number of spectra does not exceed 20, no *recognition rate* is provided.

### Nearest chemometric neighbours

The following table lists the closest chemometric neighbours of the substance/substance group *Metronidazole 25% in white petrolatum* in the substance class *APIs & excipients, liquid/semi-solid (with analysis certificate)*. Furthermore, their *Mahalanobis distance* is specified within the main model and, where appropriate, within the second-stage model.

| Substance                 | Distance in main model | Distance in second-stage model |
|---------------------------|------------------------|--------------------------------|
| Pasta Cordes <sup>®</sup> | 41.57                  | –                              |
| Permethrin 25% solution   | 43.71                  | –                              |
| Shea butter, refined      | 47.17                  | –                              |
| Isopropyl palmitate       | 56.32                  | –                              |

The list stops after the first substance with a *Mahalanobis distance* greater than 50. If the substance/substance group *Metronidazole 25% in white petrolatum* is separated from critical neighbours in a second-stage model, all the remaining substances in the second-stage model follow.

### Identity according to identity test using NIR spectroscopy

For each substance, a certificate of the correct identity is obtained from an independent GMP-certified test laboratory. If the identity of the sample can be provided using NIR on an independently tested reference sample, in the following table the *Mahalanobis distance* to the reference sample is specified as well as the *Mahalanobis distance* to the next non-identical substance:

| Sample ID | Reference sample ID | Distance to reference sample | Distance to next foreign sample |
|-----------|---------------------|------------------------------|---------------------------------|
| 30663     | 30663               | 0.00                         | 46.94                           |
| 31316     | 30663               | 10.35                        | 46.81                           |

*continued on the next page*

*continued from previous page*

| <b>Sample ID</b> | <b>Reference sample ID</b> | <b>Distance to reference sample</b> | <b>Distance to next foreign sample</b> |
|------------------|----------------------------|-------------------------------------|----------------------------------------|
| 32456            | 30663                      | 15.86                               | 48.55                                  |
| 32768            | 30663                      | 18.96                               | 48.21                                  |

The identity of a sample will be confirmed by NIR if the distance to the next foreign sample is at least 50 % greater than the distance to a reference sample whose identity has been established by laboratory testing. This criterion is always considered in the chemometric model, which contains all substances of the substance class, even if a second-stage dissolves a subgroup of similar substances, thereby increasing the distances between them. The samples confirmed by NIR support the statistical variance of the original reference substance, but cannot add new aspects or forms of the substance.

# VALIDATION REPORT

## IdentModule 2.4-2021-04

Validated substance/substance group **Mint oil / Peppermint oil**  
Substance class APIs & excipients, liquid/semi-solid (with analysis certificate)  
Report date 08/11/2021  
Report number 30856-2021-11-08  
Executing company HiperScan GmbH  
Weißeritzstraße 3  
01067 Dresden  
Germany

### Relevant substance names

Mint oil / Peppermint oil; Menthae arvensis aetheroleum partim mentholum depletum; Menthae piperitae aetheroleum; Mint oil; Peppermint oil

### Special notes

When selecting the *Mint oil / Peppermint oil* substance/substance group, the following information is displayed to the user:

*no information*

### Applicable documents

978-3-7692-7517-9 *European Pharmacopoeia 10th Edition, Basic Version 2020* [3]  
Komm2.2.40 *Erfüllung von Ph. Eur. 2.2.40 durch Apo-Ident* [4]  
AA004 *Erstellung und Validierung eines IdentModul-Updates*

### Validation method

Validation is performed after every change to the chemometric model (also “database”) in three steps:

1. The chemometric model is calculated from the calibration spectra using a *PCA algorithm*. The calibration spectra originate from the calibration samples of all substances in this class.
2. In the *chemometric model* generated, the distances between all separable substances are checked for compliance with the specified safety distances.
3. All spectra are presented to the generated chemometric model for evaluation. In three runs, the reference spectra (*Type A*), spectra from independent samples (*Type B*), and spectra from the field (*Type C*) are presented successively. Here, no single *false positive* result is permitted.

Finally, a report is generated from the validation run results and is archived together with the parameters of the model generation in audit-compliant manner.

### Number of independent samples (batches) in calibration and validation

A sample is considered independent if no sample from the same batch has been included in the calibration of the chemometric model.

| Substance/substance group | Type A | Type B | Type C |
|---------------------------|--------|--------|--------|
| Mint oil / Peppermint oil | 10     | 9      | 356    |

## Second-stage model

For differentiation of the substance/substance group *Mint oil* / *Peppermint oil* the following second-stage model is used:

*no second-stage model*

## Calibration samples

Only spectra which have been recorded by *HiperScan GmbH* from traceable samples are used for the generation of the [chemometric models](#). The following samples have been obtained from the substance/substance group *Mint oil* / *Peppermint oil*:

| Supplier | Substance      | Batch      | Sample ID | Spectra | Certificate |
|----------|----------------|------------|-----------|---------|-------------|

## Validation samples

A total of 396 793 spectra were provided for validation. The results were evaluated separately according to the following sample categories:

### Type A All calibration spectra.

- 500 spectra of 12 reference samples from the substance/substance group *Mint oil* / *Peppermint oil*. These samples are listed above in the [calibration samples](#) section. The reference samples come from 10 different batches.
- 63 439 spectra from a total of 1297 batches from further 222 substances. These spectra were recorded by *HiperScan GmbH*. *Type A* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type A* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix A](#). The samples in [Appendix A](#) were added for model generation not with the intention to have the model identify these substances, but with the intention to make the model reject them despite their similarity to substances identifiable.

### Type B Spectra from independent samples not included in the database structure. Measurement is carried out by *HiperScan GmbH*.

Samples from batches of which no spectra have been included in the database structure are considered as independent samples. The number of batches from which independent samples supplied *Type B* spectra for validation is shown below, representing the number of independent *Type B* samples. Samples, of which some of the spectra have been included in the database structure and other spectra in the validation, are marked with a <sup>†</sup>. The following applies to the remaining unmarked samples:

\*The spectra were taken from a part of the same sample which the supplier used for its analysis (identity, purity, content). In this case the manufacturer certificates proof the identity and quality of the sample from those the spectra descend.

In the same batch, there was at least one additional sample (other sales container, other sample ID) from which reference spectra (*Type A*) were included in the database structure.

- 360 spectra of 9 reference samples from the substance/substance group *Mint oil / Peppermint oil*.
- Among them are spectra of independent samples from 9 batches from which no spectra have been included in the database structure. They are sorted upwards in the following table and separated from the additional samples by a line.

| Supplier | Substance      | Batch    | Sample ID | Spectra |
|----------|----------------|----------|-----------|---------|
| Caelo    | Mint oil       | 15380509 | 32781     | 40      |
| Caelo    | Mint oil       | 16053508 | 32845     | 40      |
| Caelo    | Peppermint oil | 161904   | 32333     | 40      |

- 91 131 spectra from a total of 2007 batches from further 344 substances. These spectra were recorded by *HiperScan GmbH*. *Type B* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type B* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix B](#).

**Type C** Spectra of independent samples not included in the database structure. *Apo-Ident* customers carry out the measurements. *HiperScan GmbH* generally does not verify the information provided by the customer regarding manufacturer and batch number.

- 1274 spectra from 546 *Apo-Ident* customers from 360 batches from the substance/substance group *Mint oil / Peppermint oil*.
- Among them are spectra of independent samples from 354 batches from which no spectra have been included in the database structure. These are sorted upwards in the following table.

| Supplier              | Substance      | Batch           | Spectra |

- 240 089 spectra from 1121 *Apo-Ident* customers from a total of 46 651 batches from a further 341 substances. These spectra were recorded by *Apo-Ident* customers. *Type C* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type C* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix C](#).

## Validation results

The validation runs checked whether the substance/substance group *Mint oil* / *Peppermint oil* can clearly be distinguished from all other substances using NIR spectroscopy with *Apo-Ident*. For this purpose, all relevant spectra of the various substances were compared with *Mint oil* / *Peppermint oil* and it was evaluated how many matches (positive) and rejections (negative) were correct or incorrect. The following table breaks down the numbers of correct and incorrect results according to the expected result (*positive/negative*) and the validation spectrum type (*A/B/C*).

|               | False positive | True positive | False negative | True negative |
|---------------|----------------|---------------|----------------|---------------|
| <b>Type A</b> | 0              | 500           | 0              | 63 439        |
| <b>Type B</b> | 0              | 360           | 0              | 91 131        |
| <b>Type C</b> | 0              | 1249          | 25             | 240 089       |

The substance/substance group *Mint oil / Peppermint oil* can be clearly distinguished from all other substances. In order to make these figures comparable, the weighted *true negative rate (specificity)* and the weighted *true positive rate (recognition rate)* are determined:

|               | <b>Specificity</b>       | <b>Recognition rate</b>  |
|---------------|--------------------------|--------------------------|
| <b>Type A</b> | 100.0000 % (> 99.9797 %) | 100.0000 % (> 98.8000 %) |
| <b>Type B</b> | 100.0000 % (> 99.9656 %) | 100.0000 % (> 98.3333 %) |
| <b>Type C</b> | 100.0000 % (> 99.6849 %) | 98.0377 % (> 97.8022 %)  |

In order to ensure that each substance is entered with the same weight irrespective of the number of spectra available, each spectrum is weighted with the reciprocal value of its number. (If several new spectra of a substance with a very distinctive spectrum are added, the values for *specificity* and *recognition rate* are safer, but are by no means idealised.)

In order to illustrate the impact of the number of spectra, a comparison is made in parentheses as to how the *specificity* or *recognition rate* would worsen if three additional incorrect results were to exist amongst the spectra (*Rule of Three* [10, 11]). The larger the number of spectra, the lower the deterioration if the three hypothetical *incorrect results* were added.

Where the number of spectra does not exceed 20, no *recognition rate* is provided.

### Nearest chemometric neighbours

The following table lists the closest chemometric neighbours of the substance/substance group *Mint oil / Peppermint oil* in the substance class *APIs & excipients, liquid/semi-solid (with analysis certificate)*. Furthermore, their *Mahalanobis distance* is specified within the main model and, where appropriate, within the second-stage model.

| <b>Substance</b>                          | <b>Distance in main model</b> | <b>Distance in second-stage model</b> |
|-------------------------------------------|-------------------------------|---------------------------------------|
| Juniper oil                               | 27.26                         | —                                     |
| Dwarf pine oil                            | 31.80                         | —                                     |
| Verbena oil, nature-identical             | 33.39                         | —                                     |
| Cedar wood oil                            | 34.99                         | —                                     |
| Cypress oil                               | 36.52                         | —                                     |
| Tea tree oil                              | 36.62                         | —                                     |
| Turpentine oil                            | 36.78                         | —                                     |
| Myrtle oil                                | 37.76                         | —                                     |
| Matricaria oil, rich in (-)-alpha-bisa... | 39.76                         | —                                     |
| Petroleum ether DAB                       | 42.25                         | —                                     |
| Petroleum oil, white, cohobated           | 42.89                         | —                                     |
| Citronella oil                            | 44.15                         | —                                     |
| Juniper wood oil                          | 45.67                         | —                                     |
| Citric oil                                | 46.85                         | —                                     |
| Pine silvestris oil                       | 47.94                         | —                                     |
| Caraway oil                               | 48.89                         | —                                     |
| Acorus oil                                | 49.52                         | —                                     |
| D-alpha tocopherol                        | 50.26                         | —                                     |

The list stops after the first substance with a *Mahalanobis distance* greater than 50. If the substance/substance group *Mint oil / Peppermint oil* is separated from critical neighbours in a second-stage model, all the remaining substances in the second-stage model follow.

### Identity according to identity test using NIR spectroscopy

For each substance, a certificate of the correct identity is obtained from an independent GMP-certified test laboratory. If the identity of the sample can be provided using NIR on an independently tested reference sample, in the following table the *Mahalanobis distance* to the reference sample is specified as well as the *Mahalanobis distance* to the next non-identical substance:

| Sample ID | Reference sample ID | Distance to reference sample | Distance to next foreign sample |
|-----------|---------------------|------------------------------|---------------------------------|
| 30856     | 31410               | 11.43                        | 64.38                           |
| 31294     | 31811               | 1.94                         | 57.38                           |
| 31410     | 31410               | 0.00                         | 66.11                           |
| 31811     | 31811               | 0.00                         | 58.48                           |
| 32474     | 32474               | 0.00                         | 55.40                           |
| 32476     | 32476               | 0.00                         | 55.62                           |
| 32484     | 32476               | 3.83                         | 56.61                           |
| 32780     | 32474               | 3.88                         | 52.93                           |
| 34443     | 34443               | 0.00                         | 31.62                           |
| 34647     | 34647               | 0.00                         | 58.25                           |
| 35063     | 35063               | 0.00                         | 62.15                           |
| 35135     | 35135               | 0.00                         | 60.88                           |

The identity of a sample will be confirmed by NIR if the distance to the next foreign sample is at least 50 % greater than the distance to a reference sample whose identity has been established by laboratory testing. This criterion is always considered in the chemometric model, which contains all substances of the substance class, even if a second-stage dissolves a subgroup of similar substances, thereby increasing the distances between them. The samples confirmed by NIR support the statistical variance of the original reference substance, but cannot add new aspects or forms of the substance.

# VALIDATION REPORT

## IdentModule 2.4-2021-04

Validated substance/substance group **Myrtle oil**  
Substance class APIs & excipients, liquid/semi-solid (with analysis certificate)  
Report date 08/11/2021  
Report number 31836-2021-11-08  
Executing company HiperScan GmbH  
Weißeritzstraße 3  
01067 Dresden  
Germany

### Relevant substance names

Myrtle oil; Oleum myrte

### Special notes

When selecting the *Myrtle oil* substance/substance group, the following information is displayed to the user:

*no information*

### Applicable documents

978-3-7692-7517-9 *European Pharmacopoeia 10th Edition, Basic Version 2020* [3]  
Komm2.2.40 *Erfüllung von Ph. Eur. 2.2.40 durch Apo-Ident* [4]  
AA004 *Erstellung und Validierung eines IdentModul-Updates*

### Validation method

Validation is performed after every change to the chemometric model (also “database”) in three steps:

1. The chemometric model is calculated from the calibration spectra using a *PCA algorithm*. The calibration spectra originate from the calibration samples of all substances in this class.
2. In the *chemometric model* generated, the distances between all separable substances are checked for compliance with the specified safety distances.
3. All spectra are presented to the generated chemometric model for evaluation. In three runs, the reference spectra (*Type A*), spectra from independent samples (*Type B*), and spectra from the field (*Type C*) are presented successively. Here, no single *false positive* result is permitted.

Finally, a report is generated from the validation run results and is archived together with the parameters of the model generation in audit-compliant manner.

### Number of independent samples (batches) in calibration and validation

A sample is considered independent if no sample from the same batch has been included in the calibration of the chemometric model.

| Substance/substance group | Type A | Type B | Type C |
|---------------------------|--------|--------|--------|
| Myrtle oil                | 4      | 2      | 5      |

## Second-stage model

For differentiation of the substance/substance group *Myrtle oil* the following second-stage model is used:

*no second-stage model*

## Calibration samples

Only spectra which have been recorded by *HiperScan GmbH* from traceable samples are used for the generation of the [chemometric models](#). The following samples have been obtained from the substance/substance group *Myrtle oil*:

| Supplier | Substance  | Batch    | Sample ID | Spectra | Certificate |
|----------|------------|----------|-----------|---------|-------------|
| Caelo    | Myrtle oil | 15225102 | 31836     | 60      | 1606483     |
| Caelo    | Myrtle oil | 15225103 | 32182     | 40      | 20150721    |
| Caelo    | Myrtle oil | 15225102 | 32349     | 40      | 20150721    |
| Caelo    | Myrtle oil | 182822   | 34449     | 40      | 20181030*   |
| Caelo    | Myrtle oil | 183298   | 34458     | 40      | 20190122*   |

## Validation samples

A total of 396 793 spectra were provided for validation. The results were evaluated separately according to the following sample categories:

### Type A All calibration spectra.

- 220 spectra of 5 reference samples from the substance/substance group *Myrtle oil*. These samples are listed above in the [calibration samples](#) section. The reference samples come from 4 different batches.
- 63 719 spectra from a total of 1303 batches from further 223 substances. These spectra were recorded by *HiperScan GmbH*. *Type A* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type A* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix A](#). The samples in [Appendix A](#) were added for model generation not with the intention to have the model identify these substances, but with the intention to make the model reject them despite their similarity to substances identifiable.

### Type B Spectra from independent samples not included in the database structure. Measurement is carried out by *HiperScan GmbH*.

Samples from batches of which no spectra have been included in the database structure are considered as independent samples. The number of batches from which independent samples supplied *Type B* spectra for validation is shown below, representing the number of independent *Type B* samples. Samples, of which some of the spectra have been included in the database structure and other spectra in the validation, are marked with a <sup>†</sup>. The following applies to the remaining unmarked samples: In the same batch, there was at least one additional sample (other sales container, other sample ID) from which reference spectra (*Type A*) were included in the database structure.

- 80 spectra of 2 reference samples from the substance/substance group *Myrtle oil*.
- Among them are spectra of independent samples from 2 batches from which no spectra have been included in the database structure. They are sorted upwards in the following table and separated from the additional samples by a line.

\*The spectra were taken from a part of the same sample which the supplier used for its analysis (identity, purity, content). In this case the manufacturer certificates proof the identity and quality of the sample from those the spectra descend.

| Supplier | Substance  | Batch    | Sample ID | Spectra |
|----------|------------|----------|-----------|---------|
| Caelo    | Myrtle oil | 17227302 | 33879     | 40      |
| Caelo    | Myrtle oil | 173184   | 34082     | 40      |

- 91 411 spectra from a total of 2014 batches from further 345 substances. These spectra were recorded by *HiperScan GmbH*. *Type B* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type B* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix B](#).

**Type C** Spectra of independent samples not included in the database structure. *Apo-Ident* customers carry out the measurements. *HiperScan GmbH* generally does not verify the information provided by the customer regarding manufacturer and batch number.

- 5 spectra from 4 *Apo-Ident* customers from 5 batches from the substance/substance group *Myrtle oil*.
- Among them are spectra of independent samples from 5 batches from which no spectra have been included in the database structure. These are sorted upwards in the following table.

| Supplier | Substance  | Batch           | Spectra |
|----------|------------|-----------------|---------|
| Caelo    | Myrtle oil | 20000370001     | 1       |
| Caelo    | Myrtle oil | 15225104        | 1       |
| Caelo    | Myrtle oil | 16296202        | 1       |
| Caelo    | Myrtle oil | 183298001       | 1       |
| Taoasis  | Myrtle oil | 2018101113-9208 | 1       |

- 241 358 spectra from 1121 *Apo-Ident* customers from a total of 47 001 batches from a further 342 substances. These spectra were recorded by *Apo-Ident* customers. *Type C* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type C* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix C](#).

## Validation results

The validation runs checked whether the substance/substance group *Myrtle oil* can clearly be distinguished from all other substances using NIR spectroscopy with *Apo-Ident*. For this purpose, all relevant spectra of the various substances were compared with *Myrtle oil* and it was evaluated how many matches (positive) and rejections (negative) were correct or incorrect. The following table breaks down the numbers of correct and incorrect results according to the expected result (*positive/negative*) and the validation spectrum type (*A/B/C*).

|               | False positive | True positive | False negative | True negative |
|---------------|----------------|---------------|----------------|---------------|
| <b>Type A</b> | 0              | 220           | 0              | 63 719        |
| <b>Type B</b> | 0              | 80            | 0              | 91 411        |
| <b>Type C</b> | 0              | 5             | 0              | 241 358       |

The substance/substance group *Myrtle oil* can be clearly distinguished from all other substances. In order to make these figures comparable, the weighted *true negative rate (specificity)* and the weighted *true positive rate (recognition rate)* are determined:

|               | Specificity              | Recognition rate         |
|---------------|--------------------------|--------------------------|
| <b>Type A</b> | 100.0000 % (> 99.9798 %) | 100.0000 % (> 97.2727 %) |
| <b>Type B</b> | 100.0000 % (> 99.9656 %) | 100.0000 % (> 92.5000 %) |
| <b>Type C</b> | 100.0000 % (> 99.6866 %) | n/a (n/a)                |

In order to ensure that each substance is entered with the same weight irrespective of the number of spectra available, each spectrum is weighted with the reciprocal value of its number. (If several new spectra of a substance with a very distinctive spectrum are added, the values for *specificity* and *recognition rate* are safer, but are by no means idealised.)

In order to illustrate the impact of the number of spectra, a comparison is made in parentheses as to how the *specificity* or *recognition rate* would worsen if three additional incorrect results were to exist amongst the spectra (*Rule of Three* [10, 11]). The larger the number of spectra, the lower the deterioration if the three hypothetical *incorrect results* were added.

Where the number of spectra does not exceed 20, no *recognition rate* is provided.

### Nearest chemometric neighbours

The following table lists the closest chemometric neighbours of the substance/substance group *Myrtle oil* in the substance class *APIs & excipients, liquid/semi-solid (with analysis certificate)*. Furthermore, their *Mahalanobis distance* is specified within the main model and, where appropriate, within the second-stage model.

| Substance                     | Distance in<br>main model | Distance in<br>second-stage model |
|-------------------------------|---------------------------|-----------------------------------|
| Turpentine oil                | 17.30                     | —                                 |
| Rosemary oil                  | 20.41                     | —                                 |
| Juniper wood oil              | 21.44                     | —                                 |
| Eucalyptus oil                | 23.09                     | —                                 |
| Cypress oil                   | 24.45                     | —                                 |
| Cajeput (essentiel oil)       | 25.07                     | —                                 |
| Sage oil                      | 28.74                     | —                                 |
| Verbena oil, nature-identical | 35.19                     | —                                 |
| Spruce needle oil             | 42.97                     | —                                 |
| Dwarf pine oil                | 44.46                     | —                                 |
| Juniper oil                   | 45.03                     | —                                 |
| Cineole                       | 46.01                     | —                                 |
| Acorus oil                    | 47.21                     | —                                 |
| Peppermint oil                | 50.25                     | —                                 |

The list stops after the first substance with a *Mahalanobis distance* greater than 50. If the substance/substance group *Myrtle oil* is separated from critical neighbours in a second-stage model, all the remaining substances in the second-stage model follow.

### Identity according to identity test using NIR spectroscopy

For each substance, a certificate of the correct identity is obtained from an independent GMP-certified test laboratory. If the identity of the sample can be provided using NIR on an independently tested reference sample, in the following table the *Mahalanobis distance* to the reference sample is specified as well as the *Mahalanobis distance* to the next non-identical substance:

| Sample ID | Reference<br>sample ID | Distance to<br>reference sample | Distance to<br>next foreign sample |
|-----------|------------------------|---------------------------------|------------------------------------|
| 31836     | 31836                  | 0.00                            | 24.76                              |
| 32182     | 31836                  | 2.36                            | 26.45                              |
| 32349     | 31836                  | 2.82                            | 26.58                              |
| 34449     | 34449                  | 0.00                            | 24.45                              |
| 34458     | 34458                  | 0.00                            | 25.07                              |

The identity of a sample will be confirmed by NIR if the distance to the next foreign sample is at

least 50% greater than the distance to a reference sample whose identity has been established by laboratory testing. This criterion is always considered in the chemometric model, which contains all substances of the substance class, even if a second-stage dissolves a subgroup of similar substances, thereby increasing the distances between them. The samples confirmed by NIR support the statistical variance of the original reference substance, but cannot add new aspects or forms of the substance.

# VALIDATION REPORT

### Relevant substance names

Non-ionic hydrophil ointment; Non-ionic hydrophil ointment, conserved; Unguentum emulsificans nonionicum aquosum DAB

### Special notes

When selecting the *Non-ionic hydrophil ointment* substance/substance group, the following information is displayed to the user:

- Advice for the identification of Non-ionic hydrophil ointment DAB: Improper storage of samples can result in identification problems. Please homogenises the sample and let it adapt to room temperature before the measurement.

### Applicable documents

978-3-7692-7517-9 *European Pharmacopoeia 10th Edition, Basic Version 2020* [3]

Komm2.2.40 *Erfüllung von Ph. Eur. 2.2.40 durch Apo-Ident* [4]

AA004 *Erstellung und Validierung eines IdentModul-Updates*

### Validation method

Validation is performed after every change to the chemometric model (also “database”) in three steps:

1. The chemometric model is calculated from the calibration spectra using a *PCA algorithm*. The calibration spectra originate from the calibration samples of all substances in this class.
2. In the *chemometric model* generated, the distances between all separable substances are checked for compliance with the specified safety distances.
3. All spectra are presented to the generated chemometric model for evaluation. In three runs, the reference spectra (*Type A*), spectra from independent samples (*Type B*), and spectra from the field (*Type C*) are presented successively. Here, no single *false positive* result is permitted.

Finally, a report is generated from the validation run results and is archived together with the parameters of the model generation in audit-compliant manner.

### Number of independent samples (batches) in calibration and validation

A sample is considered independent if no sample from the same batch has been included in the calibration of the chemometric model.

| Substance/substance group    | Type A | Type B | Type C |
|------------------------------|--------|--------|--------|
| Non-ionic hydrophil ointment | 15     | 26     | 288    |

## Second-stage model

For differentiation of the substance/substance group *Non-ionic hydrophil ointment* the following second-stage model is used:

- [Submodel 06](#)

## Calibration samples

Only spectra which have been recorded by *HiperScan GmbH* from traceable samples are used for the generation of the [chemometric models](#). The following samples have been obtained from the substance/substance group *Non-ionic hydrophil ointment*:

| Supplier  | Substance           | Batch    | Sample ID | Spectra | Certificate |

## Validation samples

A total of 396 793 spectra were provided for validation. The results were evaluated separately according to the following sample categories:

**Type A** All calibration spectra.

- 700 spectra of 16 reference samples from the substance/substance group *Non-ionic hydrophil ointment*. These samples are listed above in the [calibration samples](#) section. The reference samples come from 15 different batches.
- 63 239 spectra from a total of 1292 batches from further 223 substances. These spectra were recorded by *HiperScan GmbH*. *Type A* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type A* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix A](#). The samples in [Appendix A](#) were added for model generation not with the intention to have the model identify these substances, but with the intention to make the model reject them despite their similarity to substances identifiable.

**Type B** Spectra from independent samples not included in the database structure. Measurement is carried out by *HiperScan GmbH*.

Samples from batches of which no spectra have been included in the database structure are considered as independent samples. The number of batches from which independent samples supplied

\*The spectra were taken from a part of the same sample which the supplier used for its analysis (identity, purity, content). In this case the manufacturer certificates proof the identity and quality of the sample from those the spectra descend.

*Type B* spectra for validation is shown below, representing the number of independent *Type B* samples. Samples, of which some of the spectra have been included in the database structure and other spectra in the validation, are marked with a <sup>†</sup>. The following applies to the remaining unmarked samples: In the same batch, there was at least one additional sample (other sales container, other sample ID) from which reference spectra (*Type A*) were included in the database structure.

- 1390 spectra of 35 reference samples from the substance/substance group *Non-ionic hydrophil ointment*.
- Among them are spectra of independent samples from 26 batches from which no spectra have been included in the database structure. They are sorted upwards in the following table and separated from the additional samples by a line.

| Supplier | Substance                    | Batch  | Sample ID | Spectra |
|----------|------------------------------|--------|-----------|---------|
| Caelo    | Non-ionic hydrophil ointment | 153446 | 32077     | 40      |
| Caelo    | Non-ionic hydrophil ointment | 153447 | 32078     | 40      |
| Caelo    | Non-ionic hydrophil ointment | 153463 | 32084     | 40      |
| Caelo    | Non-ionic hydrophil ointment | 161045 | 32085     | 40      |
| Caelo    | Non-ionic hydrophil ointment | 161041 | 32087     | 40      |
| Caelo    | Non-ionic hydrophil ointment | 153465 | 32106     | 40      |
| Caelo    | Non-ionic hydrophil ointment | 160438 | 32107     | 40      |
| Caelo    | Non-ionic hydrophil ointment | 161043 | 32110     | 40      |
| Caelo    | Non-ionic hydrophil ointment | 161044 | 32112     | 40      |
| Caelo    | Non-ionic hydrophil ointment | 161735 | 32417     | 40      |
| Caelo    | Non-ionic hydrophil ointment | 161736 | 32418     | 40      |
| Caelo    | Non-ionic hydrophil ointment | 161793 | 32419     | 40      |
| Caelo    | Non-ionic hydrophil ointment | 161794 | 32421     | 40      |
| Caelo    | Non-ionic hydrophil ointment | 162348 | 32488     | 40      |
| Caelo    | Non-ionic hydrophil ointment | 162349 | 32489     | 40      |
| Caelo    | Non-ionic hydrophil ointment | 162350 | 32490     | 40      |
| Caelo    | Non-ionic hydrophil ointment | 170866 | 33361     | 40      |

- 90 101 spectra from a total of 1988 batches from further 345 substances. These spectra were recorded by *HiperScan GmbH*. *Type B* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type B* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix B](#).

**Type C** Spectra of independent samples not included in the database structure. *Apo-Ident* customers carry out the measurements. *HiperScan GmbH* generally does not verify the information

provided by the customer regarding manufacturer and batch number.

- 1541 spectra from 455 *Apo-Ident* customers from 297 batches from the substance/substance group *Non-ionic hydrophil ointment*.
- Among them are spectra of independent samples from 288 batches from which no spectra have been included in the database structure. These are sorted upwards in the following table.

| Supplier            | Substance                    | Batch       | Spectra |

- 239 822 spectra from 1121 *Apo-Ident* customers from a total of 46 720 batches from a further 342 substances. These spectra were recorded by *Apo-Ident* customers. *Type C* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type C* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix C](#).

## Validation results

The validation runs checked whether the substance/substance group *Non-ionic hydrophil ointment* can clearly be distinguished from all other substances using NIR spectroscopy with *Apo-Ident*. For this purpose, all relevant spectra of the various substances were compared with *Non-ionic hydrophil ointment* and it was evaluated how many matches (positive) and rejections (negative) were correct or incorrect. The following table breaks down the numbers of correct and incorrect results according to the expected result (*positive/negative*) and the validation spectrum type (*A/B/C*).

|               | False positive | True positive | False negative | True negative |
|---------------|----------------|---------------|----------------|---------------|
| <b>Type A</b> | 0              | 700           | 0              | 63 239        |
| <b>Type B</b> | 0              | 1351          | 39             | 90 101        |
| <b>Type C</b> | 0              | 1342          | 199            | 239 822       |

The substance/substance group *Non-ionic hydrophil ointment* can be clearly distinguished from all other substances. In order to make these figures comparable, the weighted *true negative rate (specificity)* and the weighted *true positive rate (recognition rate)* are determined:

|               | Specificity              | Recognition rate         |
|---------------|--------------------------|--------------------------|
| <b>Type A</b> | 100.0000 % (> 99.9797 %) | 100.0000 % (> 99.1429 %) |
| <b>Type B</b> | 100.0000 % (> 99.9655 %) | 97.1942 % (> 96.9784 %)  |
| <b>Type C</b> | 100.0000 % (> 99.6849 %) | 87.0863 % (> 86.8916 %)  |

In order to ensure that each substance is entered with the same weight irrespective of the number of spectra available, each spectrum is weighted with the reciprocal value of its number. (If several new spectra of a substance with a very distinctive spectrum are added, the values for *specificity* and *recognition rate* are safer, but are by no means idealised.)

In order to illustrate the impact of the number of spectra, a comparison is made in parentheses as to how the *specificity* or *recognition rate* would worsen if three additional incorrect results were to exist amongst the spectra (*Rule of Three* [10, 11]). The larger the number of spectra, the lower the deterioration if the three hypothetical *incorrect results* were added.

Where the number of spectra does not exceed 20, no *recognition rate* is provided.

### Nearest chemometric neighbours

The following table lists the closest chemometric neighbours of the substance/substance group *Non-ionic hydrophil ointment* in the substance class *APIs & excipients, liquid/semi-solid (with analysis certificate)*. Furthermore, their *Mahalanobis distance* is specified within the main model and, where appropriate, within the second-stage model.

| Substance                                 | Distance in main model | Distance in second-stage model |
|-------------------------------------------|------------------------|--------------------------------|
| Base cream DAC                            | 5.00                   | 12.37                          |

| ⋮                                         | ⋮                      | ⋮                              |
| 2-ethylhexyl laurate                      | >50                    | 154.84                         |
| Squalane                                  | >50                    | 173.63                         |

The list stops after the first substance with a *Mahalanobis distance* greater than 50. If the substance/substance group *Non-ionic hydrophil ointment* is separated from critical neighbours in a second-stage model, all the remaining substances in the second-stage model follow.

### Identity according to identity test using NIR spectroscopy

For each substance, a certificate of the correct identity is obtained from an independent GMP-certified test laboratory. If the identity of the sample can be provided using NIR on an independently tested reference sample, in the following table the *Mahalanobis distance* to the reference sample is specified as well as the *Mahalanobis distance* to the next non-identical substance:

| Sample ID | Reference sample ID | Distance to reference sample | Distance to next foreign sample |
|-----------|---------------------|------------------------------|---------------------------------|
| 31001     | 31748               | 6.43                         | 15.49                           |
| 31227     | 35663               | 2.91                         | 15.30                           |
| 31451     | 31451               | 0.00                         | 15.33                           |
| 31748     | 31748               | 0.00                         | 12.76                           |
| 31749     | 31748               | 3.63                         | 15.20                           |
| 32088     | 32088               | 0.00                         | 14.47                           |

| 35663            | 35663                      | 0.00                                | 19.21                                  |

The identity of a sample will be confirmed by NIR if the distance to the next foreign sample is at least 50 % greater than the distance to a reference sample whose identity has been established by laboratory testing. This criterion is always considered in the chemometric model, which contains all substances of the substance class, even if a second-stage dissolves a subgroup of similar substances, thereby increasing the distances between them. The samples confirmed by NIR support the statistical variance of the original reference substance, but cannot add new aspects or forms of the substance.

# VALIDATION REPORT

## IdentModule 2.4-2021-04

Validated substance/substance group **Octyldodecanol**  
Substance class APIs & excipients, liquid/semi-solid (with analysis certificate)  
Report date 08/11/2021  
Report number 30867-2021-11-08  
Executing company HiperScan GmbH  
Weißeritzstraße 3  
01067 Dresden  
Germany

### Relevant substance names

Octyldodecanol; Octyldodecanolum

### Special notes

When selecting the *Octyldodecanol* substance/substance group, the following information is displayed to the user:

*no information*

### Applicable documents

978-3-7692-7517-9 *European Pharmacopoeia 10th Edition, Basic Version 2020* [3]  
Komm2.2.40 *Erfüllung von Ph. Eur. 2.2.40 durch Apo-Ident* [4]  
AA004 *Erstellung und Validierung eines IdentModul-Updates*

### Validation method

Validation is performed after every change to the chemometric model (also “database”) in three steps:

1. The chemometric model is calculated from the calibration spectra using a *PCA algorithm*. The calibration spectra originate from the calibration samples of all substances in this class.
2. In the *chemometric model* generated, the distances between all separable substances are checked for compliance with the specified safety distances.
3. All spectra are presented to the generated chemometric model for evaluation. In three runs, the reference spectra (*Type A*), spectra from independent samples (*Type B*), and spectra from the field (*Type C*) are presented successively. Here, no single *false positive* result is permitted.

Finally, a report is generated from the validation run results and is archived together with the parameters of the model generation in audit-compliant manner.

### Number of independent samples (batches) in calibration and validation

A sample is considered independent if no sample from the same batch has been included in the calibration of the chemometric model.

| Substance/substance group | Type A | Type B | Type C |
|---------------------------|--------|--------|--------|
| Octyldodecanol            | 7      | 3      | 270    |

## Second-stage model

For differentiation of the substance/substance group *Octyldodecanol* the following second-stage model is used:

*no second-stage model*

## Calibration samples

Only spectra which have been recorded by *HiperScan GmbH* from traceable samples are used for the generation of the [chemometric models](#). The following samples have been obtained from the substance/substance group *Octyldodecanol*:

| Supplier | Substance      | Batch    | Sample ID | Spectra | Certificate        |
|----------|----------------|----------|-----------|---------|--------------------|
| Caelo    | Octyldodecanol | 12165509 | 30867     | 40      | 20120711           |
| Caelo    | Octyldodecanol | 13360010 | 31330     | 40      | AR-15-FG-000314-01 |
| Caelo    | Octyldodecanol | 15135212 | 31753     | 60      | 20150506           |
| Caelo    | Octyldodecanol | 16095507 | 32958     | 40      | 20160421           |
| Caelo    | Octyldodecanol | 163127   | 33093     | 40      | 20161219*          |
| Caelo    | Octyldodecanol | 190136   | 34468     | 40      | 20190211*          |
| Caelo    | Octyldodecanol | 190961   | 34471     | 40      | 20190521*          |

## Validation samples

A total of 396 793 spectra were provided for validation. The results were evaluated separately according to the following sample categories:

**Type A** All calibration spectra.

- 300 spectra of 7 reference samples from the substance/substance group *Octyldodecanol*. These samples are listed above in the [calibration samples](#) section. The reference samples come from 7 different batches.
- 63 639 spectra from a total of 1300 batches from further 223 substances. These spectra were recorded by *HiperScan GmbH*. *Type A* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type A* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix A](#). The samples in [Appendix A](#) were added for model generation not with the intention to have the model identify these substances, but with the intention to make the model reject them despite their similarity to substances identifiable.

**Type B** Spectra from independent samples not included in the database structure. Measurement is carried out by *HiperScan GmbH*.

Samples from batches of which no spectra have been included in the database structure are considered as independent samples. The number of batches from which independent samples supplied *Type B* spectra for validation is shown below, representing the number of independent *Type B* samples. Samples, of which some of the spectra have been included in the database structure and other spectra in the validation, are marked with a <sup>†</sup>. The following applies to the remaining unmarked samples: In the same batch, there was at least one additional sample (other sales container, other sample ID) from which reference spectra (*Type A*) were included in the database structure.

- 120 spectra of 3 reference samples from the substance/substance group *Octyldodecanol*.

\*The spectra were taken from a part of the same sample which the supplier used for its analysis (identity, purity, content). In this case the manufacturer certificates proof the identity and quality of the sample from those the spectra descend.

- Among them are spectra of independent samples from 3 batches from which no spectra have been included in the database structure. They are sorted upwards in the following table and separated from the additional samples by a line.

| Supplier | Substance      | Batch  | Sample ID | Spectra |
|----------|----------------|--------|-----------|---------|
| Caelo    | Octyldodecanol | 171381 | 34052     | 40      |
| Caelo    | Octyldodecanol | 181120 | 34220     | 40      |
| Caelo    | Octyldodecanol | 192693 | 34804     | 40      |

- 91371 spectra from a total of 2013 batches from further 345 substances. These spectra were recorded by *HiperScan GmbH*. *Type B* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type B* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix B](#).

**Type C** Spectra of independent samples not included in the database structure. *Apo-Ident* customers carry out the measurements. *HiperScan GmbH* generally does not verify the information provided by the customer regarding manufacturer and batch number.

- 3672 spectra from 800 *Apo-Ident* customers from 282 batches from the substance/substance group *Octyldodecanol*.
- Among them are spectra of independent samples from 269 batches from which no spectra have been included in the database structure. These are sorted upwards in the following table.

| Supplier            | Substance      | Batch           | Spectra |

- 237 691 spectra from 1121 *Apo-Ident* customers from a total of 46 730 batches from a further 342 substances. These spectra were recorded by *Apo-Ident* customers. *Type C* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type C* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix C](#).

## Validation results

The validation runs checked whether the substance/substance group *Octyldodecanol* can clearly be distinguished from all other substances using NIR spectroscopy with *Apo-Ident*. For this purpose, all relevant spectra of the various substances were compared with *Octyldodecanol* and it was evaluated how many matches (positive) and rejections (negative) were correct or incorrect. The following table breaks down the numbers of correct and incorrect results according to the expected result (*positive/negative*) and the validation spectrum type (*A/B/C*).

|               | False positive | True positive | False negative | True negative |
|---------------|----------------|---------------|----------------|---------------|
| <b>Type A</b> | 0              | 300           | 0              | 63 639        |
| <b>Type B</b> | 0              | 120           | 0              | 91 371        |
| <b>Type C</b> | 0              | 3660          | 12             | 237 691       |

The substance/substance group *Octyldodecanol* can be clearly distinguished from all other substances. In order to make these figures comparable, the weighted *true negative rate (specificity)* and the weighted *true positive rate (recognition rate)* are determined:

|               | Specificity              | Recognition rate         |
|---------------|--------------------------|--------------------------|
| <b>Type A</b> | 100.0000 % (> 99.9797 %) | 100.0000 % (> 98.0000 %) |
| <b>Type B</b> | 100.0000 % (> 99.9656 %) | 100.0000 % (> 95.0000 %) |
| <b>Type C</b> | 100.0000 % (> 99.6849 %) | 99.6732 % (> 99.5915 %)  |

In order to ensure that each substance is entered with the same weight irrespective of the number of spectra available, each spectrum is weighted with the reciprocal value of its number. (If several new spectra of a substance with a very distinctive spectrum are added, the values for *specificity* and *recognition rate* are safer, but are by no means idealised.)

In order to illustrate the impact of the number of spectra, a comparison is made in parentheses as to how the *specificity* or *recognition rate* would worsen if three additional incorrect results were to exist amongst the spectra (*Rule of Three* [10, 11]). The larger the number of spectra, the lower the deterioration if the three hypothetical *incorrect results* were added.

Where the number of spectra does not exceed 20, no *recognition rate* is provided.

### Nearest chemometric neighbours

The following table lists the closest chemometric neighbours of the substance/substance group *Octyldodecanol* in the substance class *APIs & excipients, liquid/semi-solid (with analysis certificate)*. Furthermore, their *Mahalanobis distance* is specified within the main model and, where appropriate, within the second-stage model.

| Substance                                 | Distance in main model | Distance in second-stage model |
|-------------------------------------------|------------------------|--------------------------------|
| Macrogol-2-laurylether                    | 30.21                  | —                              |
| Hydrophilic ointment DAB                  | 30.53                  | —                              |
| Macrogol 8 stearate type I                | 32.70                  | —                              |
| Paraffin, white                           | 36.55                  | —                              |
| Wool alcohol ointment SR with white pa... | 38.42                  | —                              |
| Triglycerol diisostearate                 | 43.11                  | —                              |
| Paraffin, yellow                          | 43.82                  | —                              |
| Polyol fatty acid ester                   | 44.91                  | —                              |
| Polysorbate 60                            | 45.50                  | —                              |
| Softisan® 649                             | 47.89                  | —                              |
| Wool alcohol ointment DAB                 | 48.35                  | —                              |
| Unguentum Cordes®                         | 49.27                  | —                              |
| Lauromacrogol 400                         | 52.75                  | —                              |

The list stops after the first substance with a *Mahalanobis distance* greater than 50. If the substance/substance group *Octyldodecanol* is separated from critical neighbours in a second-stage model, all the remaining substances in the second-stage model follow.

### Identity according to identity test using NIR spectroscopy

For each substance, a certificate of the correct identity is obtained from an independent GMP-certified test laboratory. If the identity of the sample can be provided using NIR on an independently tested reference sample, in the following table the *Mahalanobis distance* to the reference sample is specified as well as the *Mahalanobis distance* to the next non-identical substance:

| Sample ID | Reference sample ID | Distance to reference sample | Distance to next foreign sample |
|-----------|---------------------|------------------------------|---------------------------------|
| 30867     | 31330               | 3.96                         | 52.74                           |
| 31330     | 31330               | 0.00                         | 53.65                           |
| 31753     | 33093               | 3.24                         | 56.48                           |
| 32958     | 33093               | 4.62                         | 55.54                           |
| 33093     | 33093               | 0.00                         | 55.18                           |
| 34468     | 34468               | 0.00                         | 55.75                           |
| 34471     | 34471               | 0.00                         | 53.13                           |

The identity of a sample will be confirmed by NIR if the distance to the next foreign sample is at least 50 % greater than the distance to a reference sample whose identity has been established by laboratory testing. This criterion is always considered in the chemometric model, which contains all substances of the substance class, even if a second-stage dissolves a subgroup of similar substances, thereby increasing the distances between them. The samples confirmed by NIR support the statistical variance of the original reference substance, but cannot add new aspects or forms of the substance.

# VALIDATION REPORT

## IdentModule 2.4-2021-04

Validated substance/substance group **Oleic acid**  
Substance class APIs & excipients, liquid/semi-solid (with analysis certificate)  
Report date 08/11/2021  
Report number 32471-2021-11-08  
Executing company HiperScan GmbH  
Weißeritzstraße 3  
01067 Dresden  
Germany

### Relevant substance names

Oleic acid; Acidum oleicum

### Special notes

When selecting the *Oleic acid* substance/substance group, the following information is displayed to the user:

978-3-7692-7517-9 *European Pharmacopoeia 10th Edition, Basic Version 2020* [3]  
Komm2.2.40 *Erfüllung von Ph. Eur. 2.2.40 durch Apo-Ident* [4]  
AA004 *Erstellung und Validierung eines IdentModul-Updates*

### Validation method

Validation is performed after every change to the chemometric model (also “database”) in three steps:

1. The chemometric model is calculated from the calibration spectra using a *PCA algorithm*. The calibration spectra originate from the calibration samples of all substances in this class.
2. In the *chemometric model* generated, the distances between all separable substances are checked for compliance with the specified safety distances.
3. All spectra are presented to the generated chemometric model for evaluation. In three runs, the reference spectra (*Type A*), spectra from independent samples (*Type B*), and spectra from the field (*Type C*) are presented successively. Here, no single *false positive* result is permitted.

Finally, a report is generated from the validation run results and is archived together with the parameters of the model generation in audit-compliant manner.

### Number of independent samples (batches) in calibration and validation

A sample is considered independent if no sample from the same batch has been included in the calibration of the chemometric model.

| Substance/substance group | Type A | Type B | Type C |
|---------------------------|--------|--------|--------|
| Oleic acid                | 3      | 2      | 1      |

## Second-stage model

For differentiation of the substance/substance group *Oleic acid* the following second-stage model is used:

*no second-stage model*

## Calibration samples

Only spectra which have been recorded by *HiperScan GmbH* from traceable samples are used for the generation of the [chemometric models](#). The following samples have been obtained from the substance/substance group *Oleic acid*:

| Supplier | Substance  | Batch    | Sample ID | Spectra | Certificate |
|----------|------------|----------|-----------|---------|-------------|
| Caelo    | Oleic acid | 15298701 | 32471     | 40      | 1702061     |
| Caelo    | Oleic acid | 163091   | 33076     | 40      | 20161212*   |
| Caelo    | Oleic acid | 20001055 | 35037     | 40      | 20200506*   |

## Validation samples

A total of 396 793 spectra were provided for validation. The results were evaluated separately according to the following sample categories:

**Type A** All calibration spectra.

- 120 spectra of 3 reference samples from the substance/substance group *Oleic acid*. These samples are listed above in the [calibration samples](#) section. The reference samples come from 3 different batches.
- 63 819 spectra from a total of 1304 batches from further 223 substances. These spectra were recorded by *HiperScan GmbH*. *Type A* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type A* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix A](#). The samples in [Appendix A](#) were added for model generation not with the intention to have the model identify these substances, but with the intention to make the model reject them despite their similarity to substances identifiable.

**Type B** Spectra from independent samples not included in the database structure. Measurement is carried out by *HiperScan GmbH*.

Samples from batches of which no spectra have been included in the database structure are considered as independent samples. The number of batches from which independent samples supplied *Type B* spectra for validation is shown below, representing the number of independent *Type B* samples. Samples, of which some of the spectra have been included in the database structure and other spectra in the validation, are marked with a <sup>†</sup>. The following applies to the remaining unmarked samples: In the same batch, there was at least one additional sample (other sales container, other sample ID) from which reference spectra (*Type A*) were included in the database structure.

- 160 spectra of 4 reference samples from the substance/substance group *Oleic acid*.
- Among them are spectra of independent samples from 2 batches from which no spectra have been included in the database structure. They are sorted upwards in the following table and separated from the additional samples by a line.

\*The spectra were taken from a part of the same sample which the supplier used for its analysis (identity, purity, content). In this case the manufacturer certificates proof the identity and quality of the sample from those the spectra descend.

| Supplier | Substance  | Batch    | Sample ID | Spectra |
|----------|------------|----------|-----------|---------|
| Caelo    | Oleic acid | 172741   | 33898     | 40      |
| Caelo    | Oleic acid | 21000914 | 35283     | 40      |
| Caelo    | Oleic acid | 15298701 | 32475     | 40      |
| Caelo    | Oleic acid | 15298701 | 32747     | 40      |

- 91 331 spectra from a total of 2013 batches from further 345 substances. These spectra were recorded by *HiperScan GmbH*. *Type B* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type B* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix B](#).

**Type C** Spectra of independent samples not included in the database structure. *Apo-Ident* customers carry out the measurements. *HiperScan GmbH* generally does not verify the information provided by the customer regarding manufacturer and batch number.

- 1 spectra from 1 *Apo-Ident* customers from 1 batches from the substance/substance group *Oleic acid*.
- Among them are spectra of independent samples from 1 batches from which no spectra have been included in the database structure. These are sorted upwards in the following table.

| Supplier | Substance  | Batch    | Spectra |
|----------|------------|----------|---------|
| Caelo    | Oleic acid | 16309108 | 1       |

- 241 362 spectra from 1121 *Apo-Ident* customers from a total of 47 005 batches from a further 342 substances. These spectra were recorded by *Apo-Ident* customers. *Type C* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type C* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix C](#).

## Validation results

The validation runs checked whether the substance/substance group *Oleic acid* can clearly be distinguished from all other substances using NIR spectroscopy with *Apo-Ident*. For this purpose, all relevant spectra of the various substances were compared with *Oleic acid* and it was evaluated how many matches (positive) and rejections (negative) were correct or incorrect. The following table breaks down the numbers of correct and incorrect results according to the expected result (*positive/negative*) and the validation spectrum type (*A/B/C*).

|               | False positive | True positive | False negative | True negative |
|---------------|----------------|---------------|----------------|---------------|
| <b>Type A</b> | 0              | 120           | 0              | 63 819        |
| <b>Type B</b> | 0              | 160           | 0              | 91 331        |
| <b>Type C</b> | 0              | 1             | 0              | 241 362       |

The substance/substance group *Oleic acid* can be clearly distinguished from all other substances. In order to make these figures comparable, the weighted *true negative rate (specificity)* and the weighted *true positive rate (recognition rate)* are determined:

|               | Specificity              | Recognition rate         |
|---------------|--------------------------|--------------------------|
| <b>Type A</b> | 100.0000 % (> 99.9799 %) | 100.0000 % (> 95.0000 %) |
| <b>Type B</b> | 100.0000 % (> 99.9656 %) | 100.0000 % (> 96.2500 %) |
| <b>Type C</b> | 100.0000 % (> 99.6937 %) | n/a (n/a)                |

In order to ensure that each substance is entered with the same weight irrespective of the number of spectra available, each spectrum is weighted with the reciprocal value of its number. (If several new spectra of a substance with a very distinctive spectrum are added, the values for *specificity* and *recognition rate* are safer, but are by no means idealised.)

In order to illustrate the impact of the number of spectra, a comparison is made in parentheses as to how the *specificity* or *recognition rate* would worsen if three additional incorrect results were to exist amongst the spectra (*Rule of Three* [10, 11]). The larger the number of spectra, the lower the deterioration if the three hypothetical *incorrect results* were added.

Where the number of spectra does not exceed 20, no *recognition rate* is provided.

### Nearest chemometric neighbours

The following table lists the closest chemometric neighbours of the substance/substance group *Oleic acid* in the substance class *APIs & excipients, liquid/semi-solid (with analysis certificate)*. Furthermore, their *Mahalanobis distance* is specified within the main model and, where appropriate, within the second-stage model.

| Substance                             | Distance in<br>main model | Distance in<br>second-stage model |
|---------------------------------------|---------------------------|-----------------------------------|
| Pasta Cordes <sup>®</sup>             | 35.65                     | —                                 |
| Metronidazole 25% in white petrolatum | 39.63                     | —                                 |
| Shea butter, refined                  | 43.83                     | —                                 |
| Permethrin 25% solution               | 45.81                     | —                                 |
| Laurel oil                            | 61.30                     | —                                 |

The list stops after the first substance with a *Mahalanobis distance* greater than 50. If the substance/substance group *Oleic acid* is separated from critical neighbours in a second-stage model, all the remaining substances in the second-stage model follow.

### Identity according to identity test using NIR spectroscopy

For each substance, a certificate of the correct identity is obtained from an independent GMP-certified test laboratory. If the identity of the sample can be provided using NIR on an independently tested reference sample, in the following table the *Mahalanobis distance* to the reference sample is specified as well as the *Mahalanobis distance* to the next non-identical substance:

| Sample ID | Reference<br>sample ID | Distance to<br>reference sample | Distance to<br>next foreign sample |
|-----------|------------------------|---------------------------------|------------------------------------|
| 32471     | 32471                  | 0.00                            | 58.64                              |
| 33076     | 33076                  | 0.00                            | 63.45                              |
| 35037     | 35037                  | 0.00                            | 65.03                              |

The identity of a sample will be confirmed by NIR if the distance to the next foreign sample is at least 50 % greater than the distance to a reference sample whose identity has been established by laboratory testing. This criterion is always considered in the chemometric model, which contains all substances of the substance class, even if a second-stage dissolves a subgroup of similar substances, thereby increasing the distances between them. The samples confirmed by NIR support the statistical variance of the original reference substance, but cannot add new aspects or forms of the substance.

# VALIDATION REPORT

## IdentModule 2.4-2021-04

Validated substance/substance group **Oregano oil**  
Substance class APIs & excipients, liquid/semi-solid (with analysis certificate)  
Report date 08/11/2021  
Report number 30669-2021-11-08  
Executing company HiperScan GmbH  
Weißeritzstraße 3  
01067 Dresden  
Germany

### Relevant substance names

Oregano oil; Oleum origani cretici

### Special notes

When selecting the *Oregano oil* substance/substance group, the following information is displayed to the user:

*no information*

### Applicable documents

978-3-7692-7517-9 *European Pharmacopoeia 10th Edition, Basic Version 2020* [3]

Komm2.2.40 *Erfüllung von Ph. Eur. 2.2.40 durch Apo-Ident* [4]

AA004 *Erstellung und Validierung eines IdentModul-Updates*

### Validation method

Validation is performed after every change to the chemometric model (also “database”) in three steps:

1. The chemometric model is calculated from the calibration spectra using a *PCA algorithm*. The calibration spectra originate from the calibration samples of all substances in this class.
2. In the *chemometric model* generated, the distances between all separable substances are checked for compliance with the specified safety distances.
3. All spectra are presented to the generated chemometric model for evaluation. In three runs, the reference spectra (*Type A*), spectra from independent samples (*Type B*), and spectra from the field (*Type C*) are presented successively. Here, no single *false positive* result is permitted.

Finally, a report is generated from the validation run results and is archived together with the parameters of the model generation in audit-compliant manner.

### Number of independent samples (batches) in calibration and validation

A sample is considered independent if no sample from the same batch has been included in the calibration of the chemometric model.

| Substance/substance group | Type A | Type B | Type C |
|---------------------------|--------|--------|--------|
| Oregano oil               | 5      | 1      | 13     |

## Second-stage model

For differentiation of the substance/substance group *Oregano oil* the following second-stage model is used:

*no second-stage model*

## Calibration samples

Only spectra which have been recorded by *HiperScan GmbH* from traceable samples are used for the generation of the [chemometric models](#). The following samples have been obtained from the substance/substance group *Oregano oil*:

| Supplier | Substance   | Batch    | Sample ID | Spectra | Certificate |
|----------|-------------|----------|-----------|---------|-------------|

| Caelo    | Oregano oil | 14242905 | 31788     | 60      | 20140904    |

## Validation samples

A total of 396 793 spectra were provided for validation. The results were evaluated separately according to the following sample categories:

### Type A All calibration spectra.

- 220 spectra of 5 reference samples from the substance/substance group *Oregano oil*. These samples are listed above in the [calibration samples](#) section. The reference samples come from 5 different batches.
- 63 719 spectra from a total of 1302 batches from further 223 substances. These spectra were recorded by *HiperScan GmbH*. *Type A* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type A* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix A](#). The samples in [Appendix A](#) were added for model generation not with the intention to have the model identify these substances, but with the intention to make the model reject them despite their similarity to substances identifiable.

### Type B Spectra from independent samples not included in the database structure. Measurement is carried out by *HiperScan GmbH*.

Samples from batches of which no spectra have been included in the database structure are considered as independent samples. The number of batches from which independent samples supplied *Type B* spectra for validation is shown below, representing the number of independent *Type B* samples. Samples, of which some of the spectra have been included in the database structure and other spectra in the validation, are marked with a <sup>†</sup>. The following applies to the remaining unmarked samples: In the same batch, there was at least one additional sample (other sales container, other sample ID) from which reference spectra (*Type A*) were included in the database structure.

- 100 spectra of 2 reference samples from the substance/substance group *Oregano oil*.
- Among them are spectra of independent samples from 1 batches from which no spectra have been included in the database structure. They are sorted upwards in the following table and separated from the additional samples by a line.

| Supplier | Substance   | Batch    | Sample ID | Spectra |
|----------|-------------|----------|-----------|---------|
| Caelo    | Oregano oil | 16011001 | 32070     | 60      |
| Caelo    | Oregano oil | 16011001 | 33469     | 40      |

- 91 391 spectra from a total of 2015 batches from further 345 substances. These spectra were recorded by *HiperScan GmbH*. *Type B* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type B* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix B](#).

**Type C** Spectra of independent samples not included in the database structure. *Apo-Ident* customers carry out the measurements. *HiperScan GmbH* generally does not verify the information provided by the customer regarding manufacturer and batch number.

- 17 spectra from 12 *Apo-Ident* customers from 14 batches from the substance/substance group *Oregano oil*.
- Among them are spectra of independent samples from 13 batches from which no spectra have been included in the database structure. These are sorted upwards in the following table.

| Supplier               | Substance   | Batch         | Spectra |
|------------------------|-------------|---------------|---------|
| /Anzag                 | Oregano oil | 46027A-5558   | 1       |
| Apotheker S Bauer&Comp | Oregano oil | 90131-59-2    | 1       |
| Caelo                  | Oregano oil | 12347604      | 2       |
| Caelo                  | Oregano oil | 16011001      | 1       |
| Caelo                  | Oregano oil | 1601101       | 1       |
| Caelo                  | Oregano oil | 16269801      | 1       |
| Caelo                  | Oregano oil | 15248805      | 1       |
| Caelo                  | Oregano oil | 18068701      | 2       |
| Euro OTC               | Oregano oil | 4431a-3102    | 1       |
| Noweda/Taoasis         | Oregano oil | 43878A-123313 | 1       |
| Taoasis                | Oregano oil | 43878A-123313 | 1       |
| Taoasis                | Oregano oil | 43878A-127300 | 1       |
| Taoasis                | Oregano oil | 124744        | 1       |
| Taoasis / Phönix       | Oregano oil | 4431A-1967    | 1       |
| Taoasis / Phönix       | Oregano oil | 4431A-3102    | 1       |

- 241 346 spectra from 1121 *Apo-Ident* customers from a total of 46 992 batches from a further 342 substances. These spectra were recorded by *Apo-Ident* customers. *Type C* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type C* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix C](#).

## Validation results

The validation runs checked whether the substance/substance group *Oregano oil* can clearly be distinguished from all other substances using NIR spectroscopy with *Apo-Ident*. For this purpose, all relevant spectra of the various substances were compared with *Oregano oil* and it was evaluated how many matches (positive) and rejections (negative) were correct or incorrect. The following table breaks down the numbers of correct and incorrect results according to the expected result (*positive/negative*) and the validation spectrum type (*A/B/C*).

|        | False positive | True positive | False negative | True negative |
|--------|----------------|---------------|----------------|---------------|
| Type A | 0              | 220           | 0              | 63 719        |
| Type B | 0              | 100           | 0              | 91 391        |
| Type C | 0              | 14            | 3              | 241 346       |

The substance/substance group *Oregano oil* can be clearly distinguished from all other substances. In order to make these figures comparable, the weighted *true negative rate* (*specificity*) and the weighted *true positive rate* (*recognition rate*) are determined:

|        | Specificity              | Recognition rate         |
|--------|--------------------------|--------------------------|
| Type A | 100.0000 % (> 99.9798 %) | 100.0000 % (> 97.2727 %) |
| Type B | 100.0000 % (> 99.9656 %) | 100.0000 % (> 94.0000 %) |
| Type C | 100.0000 % (> 99.6854 %) | n/a (n/a)                |

In order to ensure that each substance is entered with the same weight irrespective of the number of spectra available, each spectrum is weighted with the reciprocal value of its number. (If several new spectra of a substance with a very distinctive spectrum are added, the values for *specificity* and *recognition rate* are safer, but are by no means idealised.)

In order to illustrate the impact of the number of spectra, a comparison is made in parentheses as to how the *specificity* or *recognition rate* would worsen if three additional incorrect results were to exist amongst the spectra (*Rule of Three* [10, 11]). The larger the number of spectra, the lower the deterioration if the three hypothetical *incorrect results* were added.

Where the number of spectra does not exceed 20, no *recognition rate* is provided.

### Nearest chemometric neighbours

The following table lists the closest chemometric neighbours of the substance/substance group *Oregano oil* in the substance class *APIs & excipients, liquid/semi-solid (with analysis certificate)*. Furthermore, their *Mahalanobis distance* is specified within the main model and, where appropriate, within the second-stage model.

| Substance              | Distance in main model | Distance in second-stage model |
|------------------------|------------------------|--------------------------------|
| Thyme oil, thymol type | 33.14                  | —                              |
| Coriander oil          | 116.59                 | —                              |

The list stops after the first substance with a *Mahalanobis distance* greater than 50. If the substance/substance group *Oregano oil* is separated from critical neighbours in a second-stage model, all the remaining substances in the second-stage model follow.

### Identity according to identity test using NIR spectroscopy

For each substance, a certificate of the correct identity is obtained from an independent GMP-certified test laboratory. If the identity of the sample can be provided using NIR on an independently tested reference sample, in the following table the *Mahalanobis distance* to the reference sample is specified as well as the *Mahalanobis distance* to the next non-identical substance:

| Sample ID | Reference sample ID | Distance to reference sample | Distance to next foreign sample |
|-----------|---------------------|------------------------------|---------------------------------|
| 30669     | 31196               | 6.55                         | 52.91                           |
| 31196     | 31196               | 0.00                         | 50.94                           |
| 31302     | 31196               | 2.96                         | 49.39                           |
| 31406     | 31196               | 6.61                         | 49.95                           |

The identity of a sample will be confirmed by NIR if the distance to the next foreign sample is at least 50 % greater than the distance to a reference sample whose identity has been established by laboratory testing. This criterion is always considered in the chemometric model, which contains all substances of the substance class, even if a second-stage dissolves a subgroup of similar substances, thereby increasing the distances between them. The samples confirmed by NIR support the statistical variance of the original reference substance, but cannot add new aspects or forms of the substance.

# VALIDATION REPORT

## IdentModule 2.4-2021-04

|                                     |                                                                  |

### Special notes

When selecting the *Paraffin classification* substance/substance group, the following information is displayed to the user:

*no information*

### Applicable documents

978-3-7692-7517-9 *European Pharmacopoeia 10th Edition, Basic Version 2020* [3]  
Komm2.2.40 *Erfüllung von Ph. Eur. 2.2.40 durch Apo-Ident* [4]  
AA004 *Erstellung und Validierung eines IdentModul-Updates*

### Validation method

Validation is performed after every change to the chemometric model (also “database”) in three steps:

1. The chemometric model is calculated from the calibration spectra using a *PCA algorithm*. The calibration spectra originate from the calibration samples of all substances in this class.
2. In the *chemometric model* generated, the distances between all separable substances are checked for compliance with the specified safety distances.
3. All spectra are presented to the generated chemometric model for evaluation. In three runs, the reference spectra (*Type A*), spectra from independent samples (*Type B*), and spectra from the field (*Type C*) are presented successively. Here, no single *false positive* result is permitted.

Finally, a report is generated from the validation run results and is archived together with the parameters of the model generation in audit-compliant manner.

### Number of independent samples (batches) in calibration and validation

A sample is considered independent if no sample from the same batch has been included in the calibration of the chemometric model.

| Substance/substance group | Type A | Type B | Type C |
|---------------------------|--------|--------|--------|
| Paraffin classification   | 88     | 139    | 3930   |

## Second-stage model

For differentiation of the substance/substance group *Paraffin classification* the following second-stage model is used:

*no second-stage model*

## Calibration samples

Only spectra which have been recorded by *HiperScan GmbH* from traceable samples are used for the generation of the [chemometric models](#). The following samples have been obtained from the substance/substance group *Paraffin classification*:

| Supplier | Substance             | Batch            | Sample ID | Spectra | Certificate        |

\*The spectra were taken from a part of the same sample which the supplier used for its analysis (identity, purity, content). In this case the manufacturer certificates proof the identity and quality of the sample from those the spectra descend.

## Validation samples

A total of 396 793 spectra were provided for validation. The results were evaluated separately according to the following sample categories:

### Type A All calibration spectra.

- 4400 spectra of 92 reference samples from the substance/substance group *Paraffin classification*. These samples are listed above in the *calibration samples* section. The reference samples come from 88 different batches.
- 59 539 spectra from a total of 1219 batches from further 210 substances. These spectra were recorded by *HiperScan GmbH*. *Type A* samples are documented within this entire report. If the substance can be identified with this *chemometric model*, the samples are listed in the *Type A* section of each substance page. If the substance cannot be identified by this model, the samples are listed in *Appendix A*. The samples in *Appendix A* were added for model generation not with the intention to have the model identify these substances, but with the intention to make the model reject them despite their similarity to substances identifiable.

### Type B Spectra from independent samples not included in the database structure. Measurement is carried out by *HiperScan GmbH*.

Samples from batches of which no spectra have been included in the database structure are considered as independent samples. The number of batches from which independent samples supplied *Type B* spectra for validation is shown below, representing the number of independent *Type B* samples. Samples, of which some of the spectra have been included in the database structure and other spectra in the validation, are marked with a <sup>†</sup>. The following applies to the remaining unmarked samples: In the same batch, there was at least one additional sample (other sales container, other sample ID) from which reference spectra (*Type A*) were included in the database structure.

- 6121 spectra of 145 reference samples from the substance/substance group *Paraffin classification*.
- Among them are spectra of independent samples from 139 batches from which no spectra have been included in the database structure. They are sorted upwards in the following table and separated from the additional samples by a line.

| Supplier | Substance                       | Batch     | Sample ID | Spectra |

- 85 370 spectra from a total of 1875 batches from further 332 substances. These spectra were recorded by *HiperScan GmbH*. *Type B* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type B* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix B](#).

**Type C** Spectra of independent samples not included in the database structure. *Apo-Ident* customers carry out the measurements. *HiperScan GmbH* generally does not verify the information provided by the customer regarding manufacturer and batch number.

- 22 369 spectra from 1064 *Apo-Ident* customers from 3839 batches from the substance/substance group *Paraffin classification*.
- Among them are spectra of independent samples from 3711 batches from which no spectra have been included in the database structure. These are sorted upwards in the following table.

| Supplier             | Substance                       | Batch       | Spectra |

- 218 994 spectra from 1120 *Apo-Ident* customers from a total of 43 261 batches from a further 331 substances. These spectra were recorded by *Apo-Ident* customers. *Type C* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type C* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix C](#).

## Validation results

The validation runs checked whether the substance/substance group *Paraffin classification* can clearly be distinguished from all other substances using NIR spectroscopy with *Apo-Ident*. For this purpose, all relevant spectra of the various substances were compared with *Paraffin classification* and it was evaluated how many matches (positive) and rejections (negative) were correct or incorrect. The following table breaks down the numbers of correct and incorrect results according to the expected result (*positive/negative*) and the validation spectrum type (*A/B/C*).

|               | False positive | True positive | False negative | True negative |
|---------------|----------------|---------------|----------------|---------------|
| <b>Type A</b> | 0              | 4400          | 0              | 59 539        |
| <b>Type B</b> | 0              | 6121          | 0              | 85 260        |
| <b>Type C</b> | 0              | 22 266        | 103            | 215 620       |

The substance/substance group *Paraffin classification* can be clearly distinguished from all other substances. In order to make these figures comparable, the weighted *true negative rate* (*specificity*) and the weighted *true positive rate* (*recognition rate*) are determined:

|               | Specificity              | Recognition rate         |
|---------------|--------------------------|--------------------------|
| <b>Type A</b> | 100.0000 % (> 99.9796 %) | 100.0000 % (> 99.8636 %) |
| <b>Type B</b> | 100.0000 % (> 99.9656 %) | 100.0000 % (> 99.9020 %) |
| <b>Type C</b> | 100.0000 % (> 99.6822 %) | 99.5395 % (> 99.5261 %)  |

In order to ensure that each substance is entered with the same weight irrespective of the number of spectra available, each spectrum is weighted with the reciprocal value of its number. (If several new spectra of a substance with a very distinctive spectrum are added, the values for *specificity* and *recognition rate* are safer, but are by no means idealised.)

In order to illustrate the impact of the number of spectra, a comparison is made in parentheses as to how the *specificity* or *recognition rate* would worsen if three additional incorrect results were to exist amongst the spectra (*Rule of Three* [10, 11]). The larger the number of spectra, the lower the deterioration if the three hypothetical *incorrect results* were added.

Where the number of spectra does not exceed 20, no *recognition rate* is provided.

### Nearest chemometric neighbours

The following table lists the closest chemometric neighbours of the substance/substance group *Paraffin classification* in the substance class *APIs & excipients, liquid/semi-solid (with analysis certificate)*. Furthermore, their *Mahalanobis distance* is specified within the main model and, where appropriate, within the second-stage model.

| Substance                                 | Distance in<br>main model | Distance in<br>second-stage model |
|-------------------------------------------|---------------------------|-----------------------------------|
| Wool fat                                  | 9.88                      | —                                 |
| Squalane                                  | 12.13                     | —                                 |

| Permethrin 25% solution                   | 33.66                     | —                                 |
| Almond oil, refined                       | 37.90                     | —                                 |
| Isopropyl palmitate                       | 38.05                     | —                                 |
| Lauromacrogol 400                         | 42.15                     | —                                 |
| Polysorbate 60                            | 43.94                     | —                                 |
| Macroglycerol hydroxystearate 40          | 45.66                     | —                                 |
| Guaiazulene 25%, water-soluble            | 45.71                     | —                                 |
| Sesame oil, refined                       | 46.96                     | —                                 |
| Sunflower oil, refined                    | 52.00                     | —                                 |

The list stops after the first substance with a *Mahalanobis distance* greater than 50. If the substance/substance group *Paraffin classification* is separated from critical neighbours in a second-stage model, all the remaining substances in the second-stage model follow.

### Identity according to identity test using NIR spectroscopy

For each substance, a certificate of the correct identity is obtained from an independent GMP-certified test laboratory. If the identity of the sample can be provided using NIR on an independently tested

reference sample, in the following table the *Mahalanobis distance* to the reference sample is specified as well as the *Mahalanobis distance* to the next non-identical substance:

| Sample ID | Reference sample ID | Distance to reference sample | Distance to next foreign sample |
|-----------|---------------------|------------------------------|---------------------------------|
| 30932     | 30932               | 0.00                         | 17.35                           |
| 30933     | 30933               | 0.00                         | 16.24                           |

The identity of a sample will be confirmed by NIR if the distance to the next foreign sample is at least 50 % greater than the distance to a reference sample whose identity has been established by laboratory testing. This criterion is always considered in the chemometric model, which contains all substances of the substance class, even if a second-stage dissolves a subgroup of similar substances, thereby increasing the distances between them. The samples confirmed by NIR support the statistical variance of the original reference substance, but cannot add new aspects or forms of the substance.

# VALIDATION REPORT

## IdentModule 2.4-2021-04

Validated substance/substance group **Pasta Cordes®**  
Substance class APIs & excipients, liquid/semi-solid (with analysis certificate)  
Report date 08/11/2021  
Report number 30633-2021-11-08  
Executing company HiperScan GmbH  
Weißeritzstraße 3  
01067 Dresden  
Germany

### Relevant substance names

Pasta Cordes®

### Special notes

When selecting the *Pasta Cordes®* substance/substance group, the following information is displayed to the user:

*no information*

### Applicable documents

978-3-7692-7517-9 *European Pharmacopoeia 10th Edition, Basic Version 2020* [3]  
Komm2.2.40 *Erfüllung von Ph. Eur. 2.2.40 durch Apo-Ident* [4]  
AA004 *Erstellung und Validierung eines IdentModul-Updates*

### Validation method

Validation is performed after every change to the chemometric model (also “database”) in three steps:

1. The chemometric model is calculated from the calibration spectra using a *PCA algorithm*. The calibration spectra originate from the calibration samples of all substances in this class.
2. In the *chemometric model* generated, the distances between all separable substances are checked for compliance with the specified safety distances.
3. All spectra are presented to the generated chemometric model for evaluation. In three runs, the reference spectra (*Type A*), spectra from independent samples (*Type B*), and spectra from the field (*Type C*) are presented successively. Here, no single *false positive* result is permitted.

Finally, a report is generated from the validation run results and is archived together with the parameters of the model generation in audit-compliant manner.

### Number of independent samples (batches) in calibration and validation

A sample is considered independent if no sample from the same batch has been included in the calibration of the chemometric model.

| Substance/substance group | Type A | Type B | Type C |
|---------------------------|--------|--------|--------|
| Pasta Cordes®             | 6      | 3      | 41     |

## Second-stage model

For differentiation of the substance/substance group *Pasta Cordes*<sup>®</sup> the following second-stage model is used:

*no second-stage model*

## Calibration samples

Only spectra which have been recorded by *HiperScan GmbH* from traceable samples are used for the generation of the [chemometric models](#). The following samples have been obtained from the substance/substance group *Pasta Cordes*<sup>®</sup>:

| Supplier | Substance                 | Batch   | Sample ID | Spectra | Certificate |
|----------|---------------------------|---------|-----------|---------|-------------|
| Ichthyol | Pasta Cordes <sup>®</sup> | 12A008  | 30633     | 40      | 20121017    |
| Ichthyol | Pasta Cordes <sup>®</sup> | 13A056  | 31084     | 40      | 1406053     |
| Ichthyol | Pasta Cordes <sup>®</sup> | 13A056  | 31673     | 60      | 20130411    |

## Validation samples

A total of 396 793 spectra were provided for validation. The results were evaluated separately according to the following sample categories:

**Type A** All calibration spectra.

- 300 spectra of 7 reference samples from the substance/substance group *Pasta Cordes*<sup>®</sup>. These samples are listed above in the [calibration samples](#) section. The reference samples come from 6 different batches.
- 63 639 spectra from a total of 1301 batches from further 223 substances. These spectra were recorded by *HiperScan GmbH*. *Type A* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type A* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix A](#). The samples in [Appendix A](#) were added for model generation not with the intention to have the model identify these substances, but with the intention to make the model reject them despite their similarity to substances identifiable.

**Type B** Spectra from independent samples not included in the database structure. Measurement is carried out by *HiperScan GmbH*.

Samples from batches of which no spectra have been included in the database structure are considered as independent samples. The number of batches from which independent samples supplied *Type B* spectra for validation is shown below, representing the number of independent *Type B* samples. Samples, of which some of the spectra have been included in the database structure and other spectra in the validation, are marked with a <sup>†</sup>. The following applies to the remaining unmarked samples: In the same batch, there was at least one additional sample (other sales container, other sample ID) from which reference spectra (*Type A*) were included in the database structure.

- 120 spectra of 3 reference samples from the substance/substance group *Pasta Cordes*<sup>®</sup>.
- Among them are spectra of independent samples from 3 batches from which no spectra have been included in the database structure. They are sorted upwards in the following table and separated from the additional samples by a line.

| Supplier | Substance                 | Batch   | Sample ID | Spectra |
|----------|---------------------------|---------|-----------|---------|
| Ichthyol | Pasta Cordes <sup>®</sup> | 17A173  | 34046     | 40      |
| Ichthyol | Pasta Cordes <sup>®</sup> | 17A021  | 34321     | 40      |
| Ichthyol | Pasta Cordes <sup>®</sup> | 19A0101 | 34841     | 40      |

- 91 371 spectra from a total of 2013 batches from further 345 substances. These spectra were recorded by *HiperScan GmbH*. *Type B* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type B* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix B](#).

**Type C** Spectra of independent samples not included in the database structure. *Apo-Ident* customers carry out the measurements. *HiperScan GmbH* generally does not verify the information provided by the customer regarding manufacturer and batch number.

- 504 spectra from 166 *Apo-Ident* customers from 49 batches from the substance/substance group *Pasta Cordes<sup>®</sup>*.
- Among them are spectra of independent samples from 41 batches from which no spectra have been included in the database structure. These are sorted upwards in the following table.

| Supplier                      | Substance                 | Batch   | Spectra |

- 240 859 spectra from 1121 *Apo-Ident* customers from a total of 46 958 batches from a further 342 substances. These spectra were recorded by *Apo-Ident* customers. *Type C* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type C* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix C](#).

## Validation results

The validation runs checked whether the substance/substance group *Pasta Cordes*® can clearly be distinguished from all other substances using NIR spectroscopy with *Apo-Ident*. For this purpose, all relevant spectra of the various substances were compared with *Pasta Cordes*® and it was evaluated how many matches (positive) and rejections (negative) were correct or incorrect. The following table breaks down the numbers of correct and incorrect results according to the expected result (*positive/negative*) and the validation spectrum type (*A/B/C*).

|               | False positive | True positive | False negative | True negative |
|---------------|----------------|---------------|----------------|---------------|
| <b>Type A</b> | 0              | 300           | 0              | 63 639        |
| <b>Type B</b> | 0              | 120           | 0              | 91 349        |
| <b>Type C</b> | 0              | 493           | 11             | 240 487       |

The substance/substance group *Pasta Cordes*® can be clearly distinguished from all other substances. In order to make these figures comparable, the weighted *true negative rate* (*specificity*) and the weighted *true positive rate* (*recognition rate*) are determined:

|               | Specificity              | Recognition rate         |
|---------------|--------------------------|--------------------------|
| <b>Type A</b> | 100.0000 % (> 99.9797 %) | 100.0000 % (> 98.0000 %) |
| <b>Type B</b> | 100.0000 % (> 99.9658 %) | 100.0000 % (> 95.0000 %) |
| <b>Type C</b> | 100.0000 % (> 99.6808 %) | 97.8175 % (> 97.2222 %)  |

In order to ensure that each substance is entered with the same weight irrespective of the number of spectra available, each spectrum is weighted with the reciprocal value of its number. (If several new spectra of a substance with a very distinctive spectrum are added, the values for *specificity* and *recognition rate* are safer, but are by no means idealised.)

In order to illustrate the impact of the number of spectra, a comparison is made in parentheses as to how the *specificity* or *recognition rate* would worsen if three additional incorrect results were to exist amongst the spectra ([Rule of Three](#) [10, 11]). The larger the number of spectra, the lower the deterioration if the three hypothetical *incorrect results* were added.

Where the number of spectra does not exceed 20, no *recognition rate* is provided.

## Nearest chemometric neighbours

The following table lists the closest chemometric neighbours of the substance/substance group *Pasta Cordes*® in the substance class *APIs & excipients, liquid/semi-solid (with analysis certificate)*. Furthermore, their *Mahalanobis distance* is specified within the main model and, where appropriate, within the second-stage model.

| Substance                      | Distance in<br>main model | Distance in<br>second-stage model |
|--------------------------------|---------------------------|-----------------------------------|
| Guaiazulene 25%, water-soluble | 30.19                     | —                                 |
| Softisan <sup>®</sup> 649      | 43.38                     | —                                 |
| Permethrin 25% solution        | 48.94                     | —                                 |
| Macrogol 8 stearate type I     | 49.40                     | —                                 |
| Polysorbate 60                 | 54.66                     | —                                 |

The list stops after the first substance with a *Mahalanobis distance* greater than 50. If the substance/substance group *Pasta Cordes*<sup>®</sup> is separated from critical neighbours in a second-stage model, all the remaining substances in the second-stage model follow.

### Identity according to identity test using NIR spectroscopy

For each substance, a certificate of the correct identity is obtained from an independent GMP-certified test laboratory. If the identity of the sample can be provided using NIR on an independently tested reference sample, in the following table the *Mahalanobis distance* to the reference sample is specified as well as the *Mahalanobis distance* to the next non-identical substance:

| Sample ID | Reference<br>sample ID | Distance to<br>reference sample | Distance to<br>next foreign sample |
|-----------|------------------------|---------------------------------|------------------------------------|
| 30633     | 31084                  | 4.42                            | 34.08                              |
| 31084     | 31084                  | 0.00                            | 35.34                              |
| 31673     | 31084                  | 6.87                            | 35.72                              |
| 33285     | 31084                  | 4.86                            | 35.15                              |
| 34484     | 31084                  | 4.85                            | 36.89                              |
| 35104     | 31084                  | 10.87                           | 39.69                              |
| 35105     | 31084                  | 8.36                            | 39.37                              |

The identity of a sample will be confirmed by NIR if the distance to the next foreign sample is at least 50 % greater than the distance to a reference sample whose identity has been established by laboratory testing. This criterion is always considered in the chemometric model, which contains all substances of the substance class, even if a second-stage dissolves a subgroup of similar substances, thereby increasing the distances between them. The samples confirmed by NIR support the statistical variance of the original reference substance, but cannot add new aspects or forms of the substance.

# VALIDATION REPORT

## IdentModule 2.4-2021-04

Validated substance/substance group **Permethrin 25% solution**  
Substance class APIs & excipients, liquid/semi-solid (with analysis certificate)  
Report date 08/11/2021  
Report number 31177-2021-11-08  
Executing company HiperScan GmbH  
Weißeritzstraße 3  
01067 Dresden  
Germany

### Relevant substance names

Permethrin 25% solution

### Special notes

When selecting the *Permethrin 25% solution* substance/substance group, the following information is displayed to the user:

*no information*

### Applicable documents

978-3-7692-7517-9 *European Pharmacopoeia 10th Edition, Basic Version 2020* [3]  
Komm2.2.40 *Erfüllung von Ph. Eur. 2.2.40 durch Apo-Ident* [4]  
AA004 *Erstellung und Validierung eines IdentModul-Updates*

### Validation method

Validation is performed after every change to the chemometric model (also “database”) in three steps:

1. The chemometric model is calculated from the calibration spectra using a *PCA algorithm*. The calibration spectra originate from the calibration samples of all substances in this class.
2. In the *chemometric model* generated, the distances between all separable substances are checked for compliance with the specified safety distances.
3. All spectra are presented to the generated chemometric model for evaluation. In three runs, the reference spectra (*Type A*), spectra from independent samples (*Type B*), and spectra from the field (*Type C*) are presented successively. Here, no single *false positive* result is permitted.

Finally, a report is generated from the validation run results and is archived together with the parameters of the model generation in audit-compliant manner.

### Number of independent samples (batches) in calibration and validation

A sample is considered independent if no sample from the same batch has been included in the calibration of the chemometric model.

| Substance/substance group | Type A | Type B | Type C |
|---------------------------|--------|--------|--------|
| Permethrin 25% solution   | 6      | 2      | 85     |

## Second-stage model

For differentiation of the substance/substance group *Permethrin 25% solution* the following second-stage model is used:

*no second-stage model*

## Calibration samples

Only spectra which have been recorded by *HiperScan GmbH* from traceable samples are used for the generation of the [chemometric models](#). The following samples have been obtained from the substance/substance group *Permethrin 25% solution*:

| Supplier     | Substance           | Batch     | Sample ID | Spectra | Certificate |

## Validation samples

A total of 396 793 spectra were provided for validation. The results were evaluated separately according to the following sample categories:

### Type A All calibration spectra.

- 540 spectra of 13 reference samples from the substance/substance group *Permethrin 25% solution*. These samples are listed above in the [calibration samples](#) section. The reference samples come from 6 different batches.
- 63 399 spectra from a total of 1301 batches from further 223 substances. These spectra were recorded by *HiperScan GmbH*. *Type A* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type A* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix A](#). The samples in [Appendix A](#) were added for model generation not with the intention to have the model identify these substances, but with the intention to make the model reject them despite their similarity to substances identifiable.

**Type B** Spectra from independent samples not included in the database structure. Measurement is carried out by *HiperScan GmbH*.

Samples from batches of which no spectra have been included in the database structure are considered as independent samples. The number of batches from which independent samples supplied *Type B* spectra for validation is shown below, representing the number of independent *Type B* samples. Samples, of which some of the spectra have been included in the database structure and other spectra in the validation, are marked with a <sup>†</sup>. The following applies to the remaining unmarked samples: In the same batch, there was at least one additional sample (other sales container, other sample ID) from which reference spectra (*Type A*) were included in the database structure.

- 160 spectra of 4 reference samples from the substance/substance group *Permethrin 25% solution*.

- Among them are spectra of independent samples from 2 batches from which no spectra have been included in the database structure. They are sorted upwards in the following table and separated from the additional samples by a line.

| Supplier     | Substance               | Batch     | Sample ID | Spectra |
|--------------|-------------------------|-----------|-----------|---------|
| Infectopharm | Permethrin 25% solution | S041701.2 | 33940     | 40      |
| Infectopharm | Permethrin 25% solution | S122001.1 | 35454     | 40      |
| Infectopharm | Permethrin 25% solution | S041701.2 | 33941     | 40      |
| Infectopharm | Permethrin 25% solution | S122001.1 | 35455     | 40      |

- 91 331 spectra from a total of 2014 batches from further 345 substances. These spectra were recorded by *HiperScan GmbH*. *Type B* samples are documented within this entire report. If the substance can be identified with this [chemometric model](#), the samples are listed in the *Type B* section of each substance page. If the substance cannot be identified by this model, the samples are listed in [Appendix B](#).

**Type C** Spectra of independent samples not included in the database structure. *Apo-Ident* customers carry out the measurements. *HiperScan GmbH* generally does not verify the information provided by the customer regarding manufacturer and batch number.

- 589 spectra from 195 *Apo-Ident* customers from 102 batches from the substance/substance group *Permethrin 25% solution*.
- Among them are spectra of independent samples from 48 batches from which no spectra have been included in the database structure. These are sorted upwards in the following table.

| Supplier             | Substance               | Batch    | Spectra |
